Source record: 33392

Can a RME 6900 owner tell me where the L19 Notch filter adjustment is located? I have the manual but L19 is not shown in the three pictures of the components on page 10. I see it on the schematic so assume its on or under the sub chassis on top f the regular chassis.

73 and thanks.

It's definitely designed for 500Ohms input.

I can't find anything about the insertion loss. Undoubtedly such
details were made available, but nothing I have handy says anything
about it. And while I do recall a letter or two about the 2Q4 that
goes into some detail about some aspect of it, I don't recall anything
that listed specs.

The CQ Sideband Handbook, circa 1958 says nothing about the specific
loss, just that bit about the two halves having unequal loss.

One thing I've wondered about is whether these things are still
good. They are forty to fifty years old and I have no idea what
kind of capacitors were used. Just in case, you might try disconnecting
it from your circuit, and simply feeding a signal in one pin, and
checking the output, to make sure that something is getting through.
Pins 1&5 is one side of the input (it's not clear if they are
internally connected or you need to connect them together externally,
and Pins 3&7 is the other side of the input. Connect an audio source
to pin 1, and look for some sort of signal at the output pins, pin 2, and
then pin 6. Pick a frequency somewhere in the middle of the 300-3000Hz
range. Then try it with the signal source connected to the other
input pins, and again look at the output pins. It's going to be
frequency sensitive, but it might show an outright open capacitor.

Check for resistance, too, in case there is a shorted capacitor (less
likely). With pins 3 & 7 connected, there should be 770K from there to
pin 2, and 198K from there to pin 6. The resistors from pins 1&5
to the output pins have capacitors in series, so you should see
much higher resistance, unless there is a bad cap.

If I could remember where my 2Q4 is, I'd check these myself for
reference.

If the output of the 2Q4 isn't seeing a high impedance, you will
of course see higher losses through the thing, and likely won't
have proper phase shift. I never noticed before, but the circuits
I just checked all had the 2Q4 feeding the grid of a tube, or gate
of an FET, and no input resistors. They all relied on the path
through the 2Q4 and that pot at the input, for setting the input impedance.

Re: 2Q4

i.l. = 30 dB
Phase shift accuracy is +- 1.5 degree between 300 and 3000 Hz.

The 1980 Handbook has a simple application schematic, with a 600 Ohm xfmr secondary paralleled by a 500 Ohm pot with the wiper at ground for balance adjustment. One end of the xfmr winding drives pins 1 & 5 (tied together), and the other end of the xfmr winding drives pins 3 & 7 (tied together). Outputs are pins 2 and 6.

Don

Re:
<< Well Don, that is about as clear as mud!

Is this what you are trying to describe?

```
1,5>------+ +-----+----------<2
| || | |
P || S 5
R || E 0<----GND
I || C 0
| || | |
3,7>------+ +-----+----------<6
```

If not, I haven't a clue what you mean.

-Chuck, WA3UQV
>>

I did not discuss the Primary. Here's what I meant: (Set font to Courier.)

```
>------+ +-----+----------< input 1 & 5 .....2 output
| || | |
P || S 5
R || E 0<----GND 2Q4 pins
I || C 0
| || | |
>------+ +-----+----------< input 7 & 3 .....6 output
```

Each 2Q4 output is referenced to GND.

The B&K E-200C and E-200D are completely different.
The latter is solid state.

I owned (and sold) both.

Schematics were furnished with the user manuals
and I never saw a separate service manual.

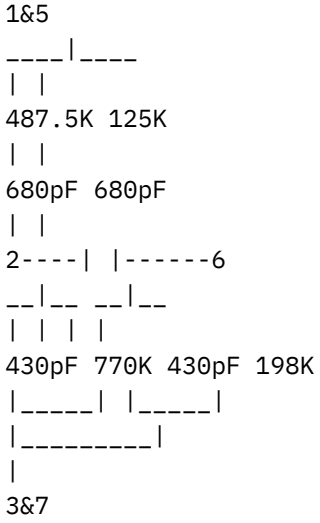
Please don't make me try to draw it.



That's out of the CQ Sideband Handbook. It shows the pairs of input
pins as already connected, so I'm not sure if there is an internal connection,
or if not, which pin goes to which network.

Remember, these came out about fifty years ago. Though simple internally,
it saved the average ham from having to scrounge precision resistors
or capacitors, or get the test equipment to select values from
less precision components. I have no idea what they sold for when
they were being sold. There were plenty of phasing rigs described that
used discrete components rather than a PSN module like this, but
this just made is somewhat easier.

The E-200C is tube, while the E-200D is solid state. Totally
different.

I called B&K, they no longer have service info on the E-200D. They
referred me to this place: http://www.bktestequipment.com

Evidently they bought the copywright to all pre-1985 B&K materials.
They must have paid big bucks, because they charge big bucks. They
charge $25 for an owners manual and $35 for a service manual. And
don't forget to add $5 shipping.

Their prices are insane, I can't imagine that they sell much. There's
no way I'm gonna pay those prices. I only paid $25 for the signal
generator!

I really wanted a service manual, but I probably won't find one. But
I will probably find a copy of the schematic somewhere. I'll keep
looking...

## 2240. WTB Receiver project

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-22 17:06:15 UTC
From: gip11@yahoo.com
Message-ID: <e1848381.0303220906.ebb5410@posting.google.com>
Source record: 33413

Looking for general coverage or ham receiver 20-40 years old tube or solid state that might need a little work or just collecting dust in your basement or attic.
Email me with details, thanks

gip11@yahoo.com

# 2241. Re: B&W 2Q4 module question

I just noticed that the CQ Sideband book says a bit more, so I'll
add it for completeness.

The capacitors are/were 2%, while the resistors were 1%.

Has it really been three years since I posted the following?

Subject: What's Inside a B&W 2Q4/350
From: n2ey@aol.com (N2EY)
Date: 19 Feb 2000 03:02:35 GMT

Hello Folks,

While going through some of my papers, I discovered some info that may be useful to anyone who is thinking of building a phasing-type SSB rig.

One of the problems with the phasing method of SSB is getting the necessary 90 degree phase shift over the audio range. Even after solutions were worked out, practical phase shift networks ("PSN"s) required very precise values of resistors and capacitors. So manufacturers began to offer packaged PSNs as components.

Probably the best-know of the PSNs was the B&W 2Q4/350, made by Barker and Williamson. These units were housed in a metal tube shell the size of a 6J5, and gave a 90 degree phase shift (plus or minus 1.5 degree) over the audio range of 300-3000 Hz. Many SSB projects in the '50s were designed around the 2Q4/350.

And B&W actually told you what was inside! They figured most hams would not have the equipment to duplicate the PSN, anyway, and they were right. But today, with highly accurate DMMs being very common and PSNs very scarce, some may want to try their hand at building one. So here's what's inside, taken from a 1955 B&W data sheet. Pin numbers are the same as any octal tube.

From Pin 1 to Pin 2: 680 uuf cap in series with 487K resistor
From Pin 2 to Pin 3: 430 uuf cap in parallel with 770K resistor
Pin 4 has no connection
From Pin 5 to Pin 6: 680 uuf cap in series with 125K resistor
From Pin 6 to Pin 7: 430 uuf cap in parallel with 198K resistor
Pin 8 has no connection

No precision is specified, but with 1% resistors and 5% capacitors readily available, it should not be too hard to get close enough. Note that there are only two capacitance values.

In most designs, Pins 1 and 5 are connected together, and Pins 3 and 7 are connected together. Balanced audio from the secondary of a plate-to-line transformer feeds Pins 3 and 5, and output to the grids of the audio stages is

taken from Pins 2 and 6.

More!

The RME 4301 SSB adaptor (meant for receivers) used a PSN, too. This one is in a rectangular metal box that's not sealed like the B&W unit. I have the data on what's inside one of those, too:

From Pin 1 to Pin 4: 2430 uuf cap in parallel with 133K resistor
From Pin 3 to Pin 4: 4860 uuf cap in seriesl with 94K resistor
Pin 2 has no connection
From Pin 5 to Pin 6: 1215 uuf cap in series with 94K resistor
From Pin 5 to Pin 8: 607 uuf cap in parallel with 133K resistor
Pin 7 is metal shell (ground)

Note that the capacitors are all even integral multiples of each other. I don't know how this unit was supposed to be used.

I don't have any of the PSN's, just the data. Hope someone can use this. Someday, I'll build one...

The key bit missing is how this is supposed to be loaded on the input.

The values are pretty much the same as the CQ Sideband book shows for
the Central Electronics PS-1 plugin. Though, it shows the resistors
to be 100K and 133.3K, at 1%, with the capacitors being 1%. It looks
like they went to standard resistors, with "oddball" capacitors, while
the 2Q4 did the reverse. The book doesn't say, but I suspect some of
those capacitors are two in parallel to get the value. The pinout
is not the same as the RME.

The book also says the same network in the Lakeshore and Central Electronics
exciters, though the implication is that they were discrete components.

The PS-1 has across the input a 100ohm pot, the wiper going to ground,
with a 1.6K resistor going to one set of inputs, and a 430ohm resistor
going to the other set.

The Heath SB-10 SSB transmit adaptor either uses the same network
as the 2Q4, or actually uses it. The schematic shows the same values,
and the same pinout.

In my previous posts, I said I couldn't tell from the CQ book if
the input pins are connected internally. Looking a bit further,
I realize they cannot be connected internally. You need them
separated in case you are using the network for receive. For
receive, you duplicate the feed circuit, ie the transformer
and the resistive divider across it, and feed each pair into
one set of the input pins (I'm not going to bother specifying

which goes which). And the output pins again feed the grid
of a triode (or gate of an FET).

# 2256. Circuit to use to build xtal osc with a 6BE6 tube?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-23 03:39:36 UTC
From: Robert Casey <wa2ise@ix.netcom.com>
Message-ID: <3E7D2C77.569DDFEB@ix.netcom.com>
Source record: 33429
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

Looking for a xtal oscillator circuit that would use the
cathode and grid 1 of a pentagrid converter tube such
as the 6BE6. This would be for the second step of
a dual conversion receiver, where the second converter
circuit operates at a fixed frequency, like 10.7MHz to 455KHz
using say a 10.245MHz crystal. Or 4.5MHz to 455KHz.

I've tried to simulate triode xtal oscillators using spice 3f4
(Circuitmaker) but the amplitudes are way smaller than
those obtained with a hartley style osc with Ls and Cs.
Maybe I did it wrong, or my xtal model is bad?...
Thus the reason to find a better circuit.

True, except that the Collins CP-1 pack omitted the ham band crystals
which were supplied with the S/Line or KWM-2 equipment.
The CP-1 case includes spaces for the standard ham crystals,
but the spaces were left empty.

Not a problem; I am looking for the shortwave bands, the Hammarlund has ham band crystals installed.
I was not aware that the Collins crystal formula was the same as the Hammarlund's.

Don't reinvent the wheel, just pick something out of any old scanner or other double conversion receiver.

Don't waste your time with simulations. Just build it. Connect the crystal from grid to ground with a grid leak in parallel. It will oscillate. Put in some cathode bias. Connect grid 3 to the signal, plate to the IF transformer.

If it doesn't work, it's probably because you forgot the heater supply.

==========

Robert:

Go to the BAMA web site at < http://bama.sbc.edu > and download the schematic for a Hammarlund HQ-180. The xtal controlled second converter is what you want. And it uses a 6BE6. I "stole" that circuit for a double-conversion modification I did on a BC-348 many years ago. I used 85 kHz IF cans from a BC-453 for the second IF strip and a 6BE6 with a 1-MHz crystal for the second mixer - works perfect with the 915-kHz IF of the BC-348.

BTW forget about SPICE, do as real engineers do - use a slide rule!

Best Regards,

Ed

Fundamental oscillator--a Colpitts would do the job.. Only
question is if the cathode capacitor to ground for the voltage
divider would have enough reactance at 455kc to avoid
degeneration..

put a 2.5 mh choke in the cathode lead. 45pf cap or 50pf trimmer from
grid to cathode. 220pf - 500pf cap
from cathode to ground. 22-47 k resistor from grid 1 to ground bypassed
by the rock.

OR put the choke in the lead from grid 2+4 and the rock from grid 2 to
grid 1 through a cap. (Pierce).

But do you still use it? I keep my old Post Versalog (late 60's
vintage) out here in the workshop, and use it frequently. It may
not carry eight or 10 or 12 digits of precision, but it's close
enough to get the job done.

>Thanks Larry

Your price is far too high for a 46 year old kit. Many
(probably, most) components need to be replaced before
building the kit. Even then, the buyer is assuming a risk a
major (possibly, irreplaceable) component is defective.
There is no support, warranty, or help.

If/when assembly is successfully done (probably, 30 hours or
so and a lot of hassles), the buyer is left with a mono amp,
fairly mediocre. Highly unlikely they will be able to obtain
a matching amp to make a stereo pair.

All this for 350 bucks (that may blossom to $400-$450 before
the thing actually plays)? You can buy a Dynaco stereo
integrated tube amp in working condition, sonically far
superior, for half the dough...

I'd say your best bet is ebay. You'll be surprised at the
number of suckers that overpay over there. It's a seller's
paradise...

From: Carl Strode <crstrode@webbworks.com>
Message-ID: <3E7E102B.4050300@webbworks.com>
Source record: 33298

My SB1000 amp is working just fine.

However, lately it has begun to make rattling noise after transmitting for several minutes.

This "rattle" does not sound like a spark or arc, but really sounds like a mechanical rattle. Peering inside through the vent holes, I don't see anything happening in there.

The noise persists for a minute or so after key up, then it slowly goes away.

I usually operate CW with plate current at 400 ma or less, and an indicated power of 700-800 watts.

Power output and low SWR is also confirmed via an in-line SWR/watt meter.

Anyone else ever hear this?

Never had that problem when I used one. The only moving part should be the cooling fan. I would look at that as well as for any loose fasteners that the fan or its air flow may vibrate. I did get transformer hum - sometimes quite loud - depending on long the amp had been used the last time; apparently related to heat and cooling cycles.

I was too young, so I got a slide rule and learned the rudiments
just on the cusp of cheap calculators. I never used a slide rule
enough to get good at it, and if I came across one, I sure couldn't
pick it up today and use it.

I suspect, though, that it is ease that have made most people switch
over to an electronic calculator, rather than high precision. People
got by with slide rules for decades, and did fine, but the moment
calculators came along, suddenly there were a lot more digits
after the decimal point, even if the average person did not need it.

OK, Max, it was a note by PAoSE Dick Rollema in the Dutch magazine
Electron, and since I would prefer not to go into translation from
Dutch to English, I brought only the drawing, believe it is
interesting as it is, but the Dutch text could be translated later

Suppose it is similar codes for Russian letters.... and Chinese...

By the way, is it some way to write the Russian letters in win98? The
Greek are easy, but it is some letters I sometimes need when
describing Russian tubes, and the only solution has been to draw them
in powerpoint (and my ex-Russian friend was impressed!).

Well, slide rules could do lots of stuff except add or subtract. I had
to use one when I first went to college. Later the TI SR50 came
out (cheaper and easier to use than those HP things) and we all
got them. BTW, when I first heard of "Reverse Polish Notation"
I thought someone was making one of those stupid ethnic slur jokes.....

Cheaper and HARDER to use than an HP. Reverse-Polish works the way you think. It's much easier to learn, and you're much less likely to make a mistake. If you do make a mistake, you can almost always back up and correct it. With algebraic notation, you rarely know you've made a mistake until you see the answer -- and even then you can't be sure.

I had a rich aunt who gave me an HP-35, making me the first undergraduate at the University of Maryland with one. I and other engineering students would sit around of an evening, with me giving them the final answers to their homework problems. God, was that a time-saver...

Just thought I would update to the previous thread that was fun to read for about a week. if you remember I told of the r390 I found in the trash here in Philly. well...a ham friend of mine stopped over last weekend and saw the r390 sitting on the floor and asked where did it come from? so I told him the story and he replied" well I guess it was the right price for that old thing." well a couple of days later he calls me and says" I am over a friends house (ham 80 yrs old) and I am helping him clean out his basement and he has one of those old radios you just got. the old man says you can have it if your interested. so I ask when can I get it? my friend says don't worry I will drop it off sunday. well its sunday and he pulls up in my drive way with his pickup and says I have something for you and I am not carrying it, so I go over to the back of the pickup and there is a r390a sitting there. I go from no r390's 2 weeks ago to having one of each; r390 and r390a today(and no out of pocket expense). well I plug it in and man does it play.has all filters and all covers and both meters but no 3tf7 tube. has a mod of a resistor and a small lamp in series. well it works. now if I just get the r390 to play I can do side by side comparisons of the two receivers. what I need now is the front builder plate for the r390a and a bottom cover for the r390. oh yeah I put out a request for the rf slugs in the r390 and friend of mine offered an old rf deck and will give it to me in timonium this weekend.well now I will just sit back and wait for the t368 to be dropped off....well I can dream can't I?

Per the 1962 - 1962 full-line catalog, it's a

Varimatch Output Transformer for P.A. "Universal unit designed to
match any tubes within the rated output power to line or voice coil."

Output impedance: 500, 200, 50, 16, 8, 5, 3, or 1.5 ohms.

Primary impedance: 3,000, 5,000, 6,000, 8,000, 10,000 or 14,000 ohms
center-tapped.

Audio power: 125 watts

Typical tubes (pairs except as noted): 807's, 4-6L6's, 845's,
4-1614's, 6146, 6159

Don't know about your need to use it, however the Katakana code has
been in use by Japanese Oprs for many many years, was a requirement
for Japanese Ship and Military - and still is heard daily on 40m CW.
Some of us "Gaijin" bacame proficient in it for a variety of reasons -
or monitoring purposes -way back when.

There's a review in Jan 1950 QST, pages 56-57.
It was called the Rothman controlled carrier modulation system.
The unit built by MarMax was an add-on screen modulator for a class c
final.
The interesting feature of the circuit was that the plate
voltage for the clamp tube screen modulator was obtained
by rectification of the rf carrier output.
The unit also doubled as a straight clamp tube,
to protect the final in the event of lost excitation in c.w. mode.

In the unit reviewed, the small box contained a single 6AS7G
twin-triode.
One section acted as an rf rectifier (grid connected to cathode).
The other half was the clamp tube.

> -- Ron

Actually the it is most likely not about buying and building an old
audio amplifier. Rather, it is probably about purchasing a piece of
electronic history (nostalgia) produced by a famous company.
While it might be cool to own a 46 year old unbuilt Heathkit, it is
certainly not where I would spend my money but who is to say what a
collector would spend? I have seen All American Five AM radio kits go

for much more on eBay as well as an unbuilt Knight Kit R-100A receiver that I think went for about $1,300. It is likely that these kits will never be built. Someone on this newsgroup (rec.radio.boatanchors) has a nice Collins 32S-3B for sale at almost $1000, and I imagine it will sell quickly and look good in someones display.

Almost everyone has some kind of passion for something nostalgic. I bid on old Hi Flier Playmate Of The Clouds Kites when they appear, but have a strict spending limit of $15.00 which is kind of outrageous when they only cost 10 cents when I was buying them in the late fifties. I would love the Hi Flier paper Box Kite but again, they always get bid up more than I want to spend. I also look for NOS slip together balsa gliders from the mid fifties to early 60s. Like many hams, I toy with the idea of putting my old Novice station back together, but then I think of the $400 or so it would take and put it on the back burner.

Hi I have the following for sale...

MINT Heath HW-8 hf QRP rig , no mods !
$140 US

Heath ID-5001 weather station, inside unit only, no sensors
complete with RARE RS-232 computer input option, and original
Heath software. Unit works fine, internal light does not work.
$230 US

Mint Heath GR-78 general coverage receiver
$125 US

MINT Heath SB-303 receiver, fully filtered
$250 US

Heath HM-2140A brown hf swr/pwr meter
$65 US

For further info or pictures, pls send me an Email ! shipping

I was too young, so I got a slide rule and learned the rudiments
just on the cusp of cheap calculators. I never used a slide rule
enough to get good at it, and if I came across one, I sure couldn't
pick it up today and use it.

I suspect, though, that it is ease that have made most people switch
over to an electronic calculator, rather than high precision. People
got by with slide rules for decades, and did fine, but the moment
calculators came along, suddenly there were a lot more digits
after the decimal point, even if the average person did not need it.

# 2307. Info Required - Standard CSA240 Rapid Battery Charger

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-25 00:54:47 UTC
From: Ed Wallis <noone@none.com>
Message-ID: <27av7v08f8lgq3a9fjoa64ub4uhuqofi92@4ax.com>
Source record: 33329

Hi,

I'm looking for a copy of the booklet that originally came with the Standard CSA240 (or any other literature).

I bought it hoping that I can use it to charge the CNB-151 and 153 batteries for my Standard C158 HT (bought used last year, with no charger)- however, the warning sticker on the side of the unit states that it should only be used for charging CNB-240 / 241 / 242 / 243 batteries. Seems odd, as this charger has an adjustable plate (and slots for it marked A through F) that would accomodate an awful lot of different battery sizes! The electrical contacts in the unit and their polarity match my batteries exactly.

A schematic would help too, if someone has one - that's one complex circuit board in this thing!

Thanks, Ed

# 2311. RME 6900 notes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-25 02:27:41 UTC
From: thompson@mindspring.com
Message-ID: <b5oefu$j8s$1@slb0.atl.mindspring.net>
Source record: 33333

One problem that seems common with the RME 6900 receiver (the last from RME then RME/Electro Voice) seems to be the couplings on the notch and antenna trimmer controls.
They come loose easily and the control no longer works.

A second problem with the notch control is that even with the coupling attached the notch may not seem to work. I was advised to switch it on and off a few times and the notch starts to work.
A good cleaning of the switch is advised.

The notch coil L19 is not properly marked in the very short manual. On page 10 there are three
photographs of the top, bottom, and top of the sub chassis. In the portion of the picture with the sub chassis transformer T8 is marked between a short and long pointer. The short pointer is indeed T8 but the longer line points to L19 which has a slug inside the can. L19 is next to the 6C4 on the top of the sub chassis.

I also found the audio on SSB distorted when the audio tube or tubes are weak. This is common when the 6AQ8 gets weak (mine read just good on a Heath TC 2). Replacing it with a tube that tested well into the good solved the problem. Two other owners reported this problem.

A final point on this receiver. Well known Contester W9IOP was a RME/EV VP and the RME 6900 was featured in QST ads(1961 and 62) as being used to win the CW sweepstakes. The truth is that Larry used his Collins 75A4 and the 6900 was merely a Cw monitor. RME made the decision to ground the AVC when the mode switch was in CW. This means a CW op would have to ride the RF gain control. Guess they decided to save a few $$$ by not setting the AVC properly as they did in other modes.

The receiver is hot and SSB and AM sound great. If I want to use it on CW I would probably get
a good outboard filter and run it in LSB.

Worked at an AM station (Collins 20V2, I think it was, 1KW AM) and the transmitter house was in a swamp. One morning after a cold night, we had a snake in the top of the final matching section. The filaments were always left on and when the HV was applied the snake was in many pieces and fully cooked. (I don't like snake in any form) We still found parts several years later.

You can still buy NOS slide rules. Last year I bought a fancy metal Pickett model, just for fun.

Is slide rule use still taught in science and engineering courses? The slide rule is useful way to understand two important concepts -- calculational precision, and the need to estimate the size of the answer before you begin the calculation.

I just bought a used Curta. Neat.

This isn't exactly a BOATANCHOR but it's sure close to it. 27 pound, 1973 manufacture and discrete except for the audio modules in the output. 12 Cassette CHANGER with speakers.

I've never seen another one like it.

This would be a perfect addition to a 1960s or 70s shack!

I'd be interested in a swap for boat anchor stuff. What do you have or what will you offer me?

See this Cassette CHANGER with speakers here:

http://home.attbi.com/~h1m/casschanger/cassettechanger.html

Thanks for looking.

Leigh---I did a lot of research before I ended up with the IFR 1500 a number of years ago. Some things to keep in mind:

--What are the long term costs of maintaining the service monitor? It's not cheap sending a unit back to IFR (but ultimately worth it obviously). And how long will the company continue to support the unit?

--BE VERY CAREFUL if you buy an IFR unit with the analog RF generator attenuator. IFR had Weinshel build those things specifically for them to be continuously variable.....they have experienced a high failure rate with those attenuators, especially (and unfortunately for me) in the 1500. I ended up having IFR rebuild mine with the digital attenuator to preclude having to potentially replace the analog version over and over.

--A guy who specializes in repairing the 500/1200 series is KG Electronics:

http://kgelectronics.netfirms.com/

He can provide you with good insight regarding the 1200 series.

--Probably a blinding flash of the obvious but make sure you get all the capability you're after. For example, having a tracking generator (an option on the 1200) is a great tool for tuning repeater duplexers. Are you buying a unit with a spectrum analyzer built in? There are 1200's that don't (the A model as I recall)---Not everyone needs it but having one offers tremendous capability.

--Units with CRT displays may have been "abused" by having a static display left on the face at high intensity. My unit showed significant "shadows" burned into the CRT face--I had IFR put a new one in when I got the unit; the problem is that replacement CRTs are now getting scarce and expensive.

--It's a tough decision to try to buy a unit from an individual from eBay for example or from a dealer....obvious difference may be saving a few bucks....but the old adage says you get what you pay for....having at least some sembance of a warranty is comforting.

Probably lots more.....e-mail me direct if you want to discuss further.

Good Luck!

Greetings, I have two restored and fully operational tranmitters for trade!

Valiant is excellent, rear case repainted by previous owner, but nicely done.
Tx has been fully restored, with W8TOW audio mods.New caps, diode blocks for HV PS, lots of new parts.
This is a heck of a performer!

And,
Ranger I...also restored with many (not all) WA1 HLR mods.
Not perfect cabnet, but good shape for age.

Will trade for:
ONLY!!!

Collins 32V2 or 32V3 transmitter. Must be in 100% operational order and easy on the eyes! NO JUNKERS! In Michigan

w8tow@arrl.net

I used to sell service monitors as a manufacturers rep (not IFR). I sold lots of new monitors over the years and once in awhile I would take a used one in trade if it was in nice shape (any brand). Problem was most every one needed something fixed. Not just IFRs but any of the used ones.

I took a 1200S in trade one time that was in nice shape. But I did notice a slight jitter in the signal generator signal. It ended up costing around $1200.00 to fix that.

Those are the reasons I stayed away from used monitors most of the time.
There are some very nice ones out there but make sure that you go through EVERY function on it to see if they all work properly. No noisy attenuaters, dirty switches, low sensitivity, out of calibration meters, jumpy signal, low signal generator output, loop unlock sometimes etc. They may be simple fixes but most likely they will be expensive fixes. You need to knock off big bucks on the price for anything that is not in perfect shape. They are not cheap to fix. If you have to send one the the factory for repair you can count on a minimum of $1000.00 or more for a simple repair. Just calibration runs $700.00 or more.

The 1200 is a good monitor if you find a good working one. Although they are getting a little long in the tooth. Not cheap to repair though.

BC-684 (SCR-608/628) is a fairly wideband FM transmitter, chrome pushbuttons and all, goes from 20-28.9 MHz. One might use it on the high end of 10... maybe? Value? Try Epay. I see the companion receivers (BC-683) going for a good price. If its complete, has the dynamotor, nice, and isn't rusted up.. you may be surprised what someone might pay. You see these sets installed in the M3 and M4 tanks (WWII). See also Humphrey Bogart film "Sahara". They clearly show the SCR-508 inside Lulubell. . FYI........

# 2337. S meter question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-26 01:32:48 UTC
From: tchrme@aol.com
Message-ID: <20030325203248.17427.00000280@mb-mj.aol.com>
Source record: 33260

Hello all,
I recently restored a Hallicrafters SX28A. Needed recapping and aligning, although the filter caps were good and I left them in. I also did not attack the buried caps in the rf compartment as the set appears to work fine.
My question concerns the S meter. If I zero it a little while after the set is turned on, it needs rezeroing (drifts upward) after the set is at operating temp for a while. Is this normal for this set or is there a problem. Possibly resistor drift? I have seen this on some other sets too and have wondered about it. Thanks for the help, Mike KF6KXG

That meter runs off a 100 ohm 2 watt (I think) resistor that can get pretty hot. You mght check that and replace it if original. It's R28. You might as well check R30 and R29 (the s-meter adjustment pot) while your at it. I had to replace mine.

## 2340. Re: S meter question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-26 03:47:19 UTC
From: Phil Nelson <philnelson@antiqueradio.orgNOSPAM>
Message-ID: <bp9ga.19711$pK4.1762667@newsread1.prod.itd.earthlink.net>
Source record: 33263

It is a common trouble spot in this receiver. You can read some S-meter notes in the article at http://antiqueradio.org/halli12.htm . The SX-28 has two AVC lines, so check for out-of-spec resistors, etc., on both.

Not to be a wet blanket, but I believe some of the bad buried caps in the RF section are involved in AVC, so if you decline to replace the bad boys (I can relate!), you may need to put up with less-than perfect S-meter performance.

Regards,

Phil

## 2341. S-38B BFO Alignment

Source record: 33268

Hi all, rcv'd a dx-40 the other day, put in some 80 meter xtals and chatted with some friends (cw) after a half hour I heard my tone in the rcvr sound raspy on and off. they confirmed it and that it wasnt chirp or whooping. i have not popped the hood on it yet(i'd rather play) to check tubes, caps or anything, tuneup was by watching the powerout on my mfj tuner as the dx40 meter is shot.
Just wondering if there are any hints/kinks on this xmtr. also what might be a good meter (i think a 0-150 milliamp) to replace it with. thanks for any info, I love these old novice rigs, fun, and gets neat comments from the other guy sometimes. I worked a fellow the other night with my new(to me) EICO 720, and he had never heard of such a thing. reminds me, I have to take pix of station to print out personalized qsl's for the BA qso's, I had been doing that b4 with my adventurer.

Hi Jim,

Isn't it fun to operate old novice rigs? I guess the one
big "down side" is that crystals are hard to come by (if
you're not willing to plunk down $20 each for new ones!).
I've been collecting rocks for years, and I now have just
about 100 of them for 80m and 40m CW freqs.

Sounds like the filter caps in your DX-40 are goin' south.
I'd replace them before trying anything else. Check the
tubes, too. As for hints and kinks, the power transformer
in all of the old Heathkit novice rigs is a sore spot. The
DX-20, DX-35, DX-40, and DX-60 series all suffer from weak
transformers. Don't overstress it or you'll be shopping for
a replacement (which is made of that ever-popular material,
"Unobtainium"). The meter movement in the old Heath rigs is
also a "problem child". Easiest thing, short of finding one
from a parts rig, is just to use a common 0 - 1 mA meter and
shunt it for the desired range. Just don't hack up the front
panel when changing meters, in case you do come across an
exact replacement somewhere down the line.

You're right about the newer hams having no clue what a rig
like the Eico 720 is. My favorite tube xmtr is my homebrew
band-blaster that runs a 6V6 xtal osc and an 807 PA. Quite
often, I get asked what an 807 is. :) I direct the other
guy to my web site to look at the pictures and read the text
(and hopefully learn something!).

==========
Both the S-38B and S-38C have an "ocsillating IF" type BFO. There is
no separate BFO adjustment. With the IF properly aligned, the "BFO"
should oscillate in the center of the IF passband (which is as broad
as a barn). The original S-38 had a separate BFO oscillator and could
be adjusted by removing the BFO "pitch" knob and turning the
adjustment screw (that moved a slug) and then replacing the knob with
the red dot pointing up. You can go to the BAMA web site <
http://bama.sbc.edu > and download a manual for your S-38B for free.

I think you want a Fisher 400 not a 400c. The 400c is an older
Fisher stereo preamp.

Thanks for the correction Conrad! Yes - that would be a Fisher 400, 500b/c,
or 800b/c.

Trav,
If I remember right from the last time I worked on one of these the amount of BFO injection on the S38 series can be varied during serving by the position of the heavy wire that feeds back the signal. The "floating end" is normally around a couple tube pins and its position can be tweaked to increase it. Mike KF6KXG

Brian,
Thanks for the advice. I forgot to mention that I also replaced the S mtr pot as it was working but flaky. I also replaced the resistor that was connected to it.
Since everything except the S mtr is working well, I will probably wait for another problem before I pull the beast out of its case again. I was just collecting some data for when that day comes.

Phil,
Thanks for the advice. Since only the S mtr is having probs and the rest of the radio is working well at this pt, I will probably wait for the next problem to surface before opening this beast up again. I think sooner or later the rf decks on my 28A and 42 will need some work. The 42 is even worse than the 28A and is designed for nanoprobe repair only. I would give a lot of $ to listen in to the engineers who designed them about the repairablity of these two units.

I own and use both the 400 and 800B. Used to own a 500C but the clicking of the stereo relay drove me crazy (or should that be crazier) when tuning across the dial, so I traded it away. All fine receivers, anyhow.

Hi. Just wondering if anyone out there has changed the original
Drake RX 1st IF filter and therefore has one available. Am
musing over the idea of whether to use this filter in my RX.

If you have the a filter perhaps you could just drop me a post,
then I can know if I can get hold of this filter. Please
indicate what you might be wanting for it (hopefully cheap) :c).

My email:

news_email@REMOVEntlworld.com

Please remove "REMOVE".

Anyone have the specs for this filter? I know it's about 8 Khz
bandwidth. I don't know terminating impedances.

TIA. Rich.

That filter is generally thought to be the biggest impediment
to the stock R4C being a good receiver. I would assume it was
a marketing decision, intended to make it more attractive by
lowering the price.

If you are not going to market your receiver, you probably don't
want to use that particular filter!

Instead, either watch eBay for one of the replacement filters,
or you might look into some of the AM filters for other receivers.

A quick search in eBay came up with current examples:

6 kHz / 5.645 mHz for Drake R4C
6 kHz / 9.010 mHz for ICOM
6 kHz / 3.180 mHz for Yaesu FT-101

A search of past auctions gives an idea of prices:

6 kHz / 5.645 mHz for Drake TR-7 $ 90.00
6 kHz / 5.645 mHz for Drake TR-7 87.00
6 kHz / 5.645 mHz for Drake TR-7 84.99
6 kHz / 5.645 mHz for Drake R4C 111.05
6 kHz / 5.645 mHz for Drake R4C 102.50
6 kHz / 8.830 mHz for Kenwood TS-430S 62.00
6 kHz / 8.830 mHz for Kenwood TS-430S 65.00

A google search came up with other examples:

8 kHz / 5.645 mHz for Drake TR-7

Plus of course there are the commonly available 6 kHz and 8 kHz
replacement filters for the R4C available for about $105 each
from INRAD.

And you might want to consider more than one filter and
switching between them. Both the 8 kHz and 6 kHz filters are
wider than necessary for SSB or CW and using switchable narrower
filters is probably a *much* preferable system from a
performance point of view. The only benefits to using the
wide filter early in the IF chain are 1) lower cost compared to
switching filters, 2) transient response for the Noise Blanker,

and 3) passband tuning of the entire second filter bandwidth.
If you don't need 2 or 3, the cost of switching between narrower
filters is probably worth the performance gain for a one time
only receiver project.

If you go with narrow filters, Ten-Tec uses filters at 9001.5
and 6298.5 kHz, Heathkit used HF filters, and I suppose there
are many many others.. INRAD, for example, sells a 2.8 kHz
filters that could be followed by almost any of the common
narrower (2.4, 2.3, 2.1, 1.8 etc.) filters. For CW a 600 Hz
filter can be used in front of a 600 Hz filter, or use 500/400,
400/300, or 300/250 combinations depending on what you can find.

Most of the INRAD filters have information available on them
at <http://www.qth.com/INRAD/>, and they list the frequencies
of various replacement filters which can be used sometimes to
identify less than well described used filters found for sale
in other places.

>If you have the a filter perhaps you could just drop me a post,
>then I can know if I can get hold of this filter. Please
>indicate what you might be wanting for it (hopefully cheap) :c).

With filters though, you are going to get what you pay for. If
it will do you well enough, INRAD has $24 filters too. :-)

Source record: 33144

I have two like new digital displays for Collins gear. One is the
Spectronics DD-1C that works with all S-Line receivers like the 75S1/3/B/Cs
or the KWM-2s. It works very well and includes the original manual and
connecting cables. Price is $175. No modifications are required. It is plug
and play.

The other one is the Grand Systems GD-6C Automatic Calculating Display.
There is no band switch on this one.
It follows you to all ham bands and short wave frequencies. This one is set
to work with all S-Line receivers, but it can be made to work with KWM-2s.
It comes with all interconnecting cables for the S-Line and all original
instructions. It does require a small wall wart for 500ma and 12 VDC
regulated which was lost during a move. This is a nice display and works
great. It is also plug and play. No mods required for the S-Line receivers.
Price is $225.
Thanks, Charlie Hugg, K5MBX CCA 307

I spent about $160 for the Yaesu 50 line, that is FL50B, FR50B, FV50B. It is a budget system really, but quite good. A beginners set. However, I'm trying to spend not very much at all improving 2nd mixer cross mod as well as improving the main selectivity (acheived at 455 Khz, 2nd IF). Heck I only paid $160 for the entire set-up! :c)

I've thought the filter to help stop the 2nd mixer from cross modulation needs to be 8 Khz wide. Such a filter will pass SSB/CW/AM, the real bandpass shaping takng place at the 2nd IF. But, actually, maybe I could go with a 6 Khz filter. For some reason the filter to "protect" mixer cross mod in the Drake RX's is 8khz wide, and I've taken my cue from this fact.

I think using a wide filter in the 1st IF would allow for passband tuning as you mention below. And I was thinking about arranging for passband tuning. I was hoping to have a good SSB and a CW filter in the 2nd IF.

The Drake filter would improve things, maybe I could get one really cheap, but would it do the job. That I don't know. Bit of a risk maybe, but if I could get one cheap maybe it's worth the risk.

Might actually be best making my own filter, but will look at "store bought" for a while.

# 2376. Drake TR&/PS& problem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-27 22:08:42 UTC
From: Doug <dslosty@pipeline.com>
Message-ID: <4jt68v4m7sdga3v9ug30pqgftt23ukr2lv@4ax.com>
Source record: 33149

I just bought a PS7 supply to use with my Drake TR7.
The transceiver had worked fine with an Astron RS35 supply.

However, after using it for an hour or so with the PS7, the audio of
the TR7 starts to "howl" while in receive mode. The volume contro has
no effect.

At first I thought that the 24V multivibrator circuit in the TR7's PCB
was malfunctioning but it's fine. Transmit operations are normal.

It seems like something in the PS7 is oscillating and it's being
picked up by the TR7.

Has anyone seen this problem?

tnx,

Doug/WA1TUT

OK, now I've got a better idea what you are doing!

I did a web search looking for a manual for the receiver, and
didn't find anything. Do you know of an online description or
manual that gives details on the IF and mixer schemes?

>I've thought the filter to help stop the 2nd mixer from cross
>modulation needs to be 8 Khz wide. Such a filter will pass
>SSB/CW/AM, the real bandpass shaping takng place at the 2nd IF.
>But, actually, maybe I could go with a 6 Khz filter. For some
>reason the filter to "protect" mixer cross mod in the Drake RX's
>is 8khz wide, and I've taken my cue from this fact.

In the Drake design the 1st IF filter has to be at least twice
as wide as the widest 2nd IF filter because there is only one
1st IF filter and it has to pass _both_ sidebands, only one of
which is selected by the 2nd IF filter, but since either of them
could be, they both have to be there. The actual width has to
be a little wider than that because, or at least I think it is
because, the noise blanker's gate is after the filter instead of
before it.

Hence, you don't necessarily have the same design criteria that
Drake did (though it is entirely possible that in fact you will
end up with the same requirements).

>I think using a wide filter in the 1st IF would allow for
>passband tuning as you mention below. And I was thinking about
>arranging for passband tuning. I was hoping to have a good SSB
>and a CW filter in the 2nd IF.

But you also (as is obvious from the commonly derogatory
comments about the original Drake filter) want to have
selectivity as early as possible. The difference may or may not
affect you though. For example, sitting here at the top of the
world I don't exactly have to pick signals out of a crowded

band. I hear more auroral buzz than I do QRM from the one other ham in town that operates HF. Maybe the tighter specs on a roofing filter rarely do me any good at all! :-)

But for someone near an urban center (particularly if they are "smart" and found a great location at the highest elevation around) that extra 20 to 40 dB of floor on a good filter will be the difference between ability to get into DX pileups or operate contests, or not.

>The Drake filter would improve things, maybe I could get one
>really cheap, but would it do the job. That I don't know. Bit
>of a risk maybe, but if I could get one cheap maybe it's worth
>the risk.

One advantage to doing it that way is the low expense of testing your theory... and if it works but needs a better filter _then_ you can spend the money on a drop in replacement. Anything else you do won't be a drop in replacement so much as a total (ouch) redesign...

>Might actually be best making my own filter, but will look at
>"store bought" for a while.

It's one of those "variables", that goes into the entire juggling act. :-) There are tradeoffs...

>Thanks for the info on prices. I'll keep searching Ebay and see
>what comes up and for what price it sells for.

Hmmm... I don't see very many "cheap" filters on eBay, or anywhere else. They all seem to go for premium rates. Buying two filters would more than double your investment! But that might be just the way to go.

Here are some thoughts:

If you don't need AM, you don't need anything wider than just more than twice your SSB filter bandwidth.

If you don't use the same passband tuning design that Drake did, you probably don't need a 1st IF filter to handle two sidebands. I don't find the passband tuning to be very useful for SSB, but for RTTY and CW it is essential. Which suggests that perhaps a 3.0 kHz 1st IF filter would be just fine, even though it would provide only slight adjustment of the passband on SSB. (Hmmm... maybe I should try that myself!)

Also, you can set up a passband tuning system that uses only two filters one at the 1st IF and one in the 2nd IF, that are offsetting as the passband is tuned, thus giving you variable bandwidth with only two filters. I previously posted a description of the most versatile way that could be done, but it could also be done using only the passband tuning to also

control the offset between the two filters and thus the bandwidth. (It could also be done using only 2 IF's but then the "center frequency" changes as things get tuned.)

I take it you are going to replace all of the oscillators and mixers, hence the entire frequency scheme is up for grabs as part of this project? (Find either a Collins PTO or a Drake PTO, you'll be lots happier with the stability.) I really do like the basic scheme that Drake used, but it requires some very careful attention to detail for the AGC too. In particular the RF and 1st mixer need to have good dynamic range and appropriate AGC to keep the signal levels under control before they hit the later mixer stages. (That's why they used a remote cutoff tube, the 6BA6, for the RF stage instead of a sharp cutoff that is so commonly seen.)

Actually, with the FR50B, if you only want to receive LSB on
80/40, and USB on 20/15/10 that 1st IF filter can be less than 8

Khz. You only need 8 Khz if on any particular band you want to switch sidebands and you don't alter the VFO frequency. (You don't really want to alter the VFO if a station went from USB to LSB). So, I'd say a 6Khz filter would be okay. Because of frequency translation being different for 80/40 and for 20/15/10, LSB (8/40) and USB (20.15/10) sidebands always land within the 3 Khz filter passband at 455Khz. Switching sidebands on a particular band would call for two SSB filiters at 455 Khz, or alteration of the 2nd mixer xtal osc frequency. I intend to alter the 2nd mixer xtal osc to cater for CW. To put the CW carrier on 455 Khz, rather than just off the centre frequency as with SSB.

What I was thinking is this:

Assuming that VFO is not changed when transmiting station goes
from SSB to CW:

Have a 1st IF with BW say anything from 4 to 8 Khz. Wider
bandwidth allows for greater passband tuning. (Probably only
need about 5 Khz with the FR50B if not wanting to change
sidebands on a particlar band).

Use a 2.5 Khz SSB filter centered on 455 Khz and CW filter
centered on 455 Khz. Have 2nd mixer be a VXO with varicap that
can be switched in, or with potentiometer marked SSB and CW. When
on SSB the carrier lands off-center of 455 Khz, (say 456.5).
When on CW flick switch or adjust pot. and that puts carrier on
455 Khz dead center of the CW filter. Vary pot. and that will
have the effect of moving the SSB signal across passband of SSB
filter.

I think the above is passband tuning.

But, the BFO signal must also track the sideband. I must figure
that out.

SSB

You have 2nd mixer VXO set to SSB. You have BFO marked SET. Here
sideband is "correctly" positioned in passband and BF0 is at the
suitable frequency. Move VXO pot. and that moves sideband across

passband. Now, just alter BF0 untill audio resolves. Don't think there is a need for automatic tracking of BFO when VXO is tuned. Could arrange for that, you just derive BFO frequency from 2nd mixer VXO.

Ought to study what Drake did.

The 6BE6 sounds like the product detector from his discription.
I'd guess it is an infinite impedance detector on AM.

Leigh

I bought a CSM-50A on eBay a few years back because it had
the tracking generator and spectrum analyzer options;
but I use an IFR at work.

Nice units, but the question is what is your use for one?
Unless it is going to be a money maker, as others noted they are
difficult to fix, and as one monitor repair shop told me "there is
nothing inexpensive" in them when they break!! So far I've been
able to fix the problems in my unit, but when the day comes the
YIG oscillator quits, it may be a parts unit back on eBay.

Most of the Cushman stuff is getting a bit dated. Sometimes
I think buying the functions as separate pieces of test gear
makes more sense, unless size is an issue.

Mike:
When you do, please note the location ond postion of the washers and other hardware when you remove the knobs and faceplate (if you do). I made the mistake of not tracking where each washer and grommet went and when putting the faceplate back on, I couldn't figure out what went where. Since then I have been completey unable to find any documentation about that (exploded views, etc.). Maybe you can help me!! I'm not at all sure that I didn it right.

A drift in S-meter reading as a receiver warms up, even from one time of the year to another, can result from a semi-conductor silicon diode in the Automatic Gain Control DC detector circuit.

The voltage at which the diode begins to conduct is temperature dependent. As temperature increases the receiver incorrectly thinks the signal level has increased.

Some, but not all, modern all solid-state receivers have a thermistor in the IF amplifier gain control circuitry to partially compensate.

Very thoughtful these Japanese receiver designers!

This radio, however, is a 1941 vintage with 15 tubes and absolutley NO solid state parts. The design is very unige with a double action AVC system but also very complicated with a high parts count and a very crowded RF section even though it's huge. It also weight about 90 lbs in the case.

# 2391. WTB 1/4" & 3/8" shaft adapters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-28 06:32:21 UTC
From: Paul and Linda Cooper <plcooper@starband.net>
Message-ID: <3E83EC86.4000801@starband.net>
Source record: 33164

WTB shaft adapters, both 1/4" & 3/8", all metal with two set screws each side.

Need 3/8" shaft inside to 1/4" solid shaft outside; Need 3/8" shaft inside to 3/8" shaft inside;
Need 1/4" shaft inside to 1/4" shaft inside.

These adapters will probably be no longer than 1.5" overall.

Paul, K6PY

Many thanks to all for the replies, both here and email.

IFR is the big winner by general concensus, which confirms my earlier assumption. I'll see what I can find from them.

Thanks again for all the help.

# 2397. Passband tuning in the Drake R4C

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-28 21:46:20 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <b62fo3$t0fm$1@ID-150848.news.dfncis.de>
Source record: 33170

I think I understand it.

I drew a block diagram from a description and this is what I got. SSB at 1st IF of 5645 Khz goes to V3 2nd Mixer. BFO at 50Khz also goes to V3. BF0 is additively mixed with 1st IF and so a signal of 5695 Khz goes to CW/SSB xtal filters in 2nd IF. BFO is variable, so carrier can be made to sit at either side of filter center frequency, or indeed dead center of a filter passband. So, passband knob for SSB is either at left or right position, depending on USB or LSB.

Okay, but so far this is just moving a SSB signal across the (at 5695 Khz) filter passband.

Resolving SSB requires BFO injection at correct frequency. I've got the BFO also feeding a product detector. A 50 Khz signal is fed to the P.D. as well as the BFO signal. When passband tuning is at center the received carrier sits at 50 Khz in the 3nd IF chain and the BFO is at 50 Khz. This is correct to resolve SSB. When passband tuning is (say) on USB, the BFO will be on (say) 48.5 Khz. Then, received carrier (if there was one to receive, it's suppressed) sits at 48.5 Khz in the "50 Khz", 3nd IF chain. This is correct to resolve SSB, because the suppressed carrier sits there now. In fact, with this system, changing the BFO frequency has the effect of moving the signal across the filters passband, with BFO injection automatically tracking with the the sideband energy.

Like I say, that I think describes Drake's passband tuning. Pretty neat. Of course, the frequency readout on your R4C dial shows the correct receive frequency, as the VFO does not change frequency. If I have it wrong, please let me know. Thanks.

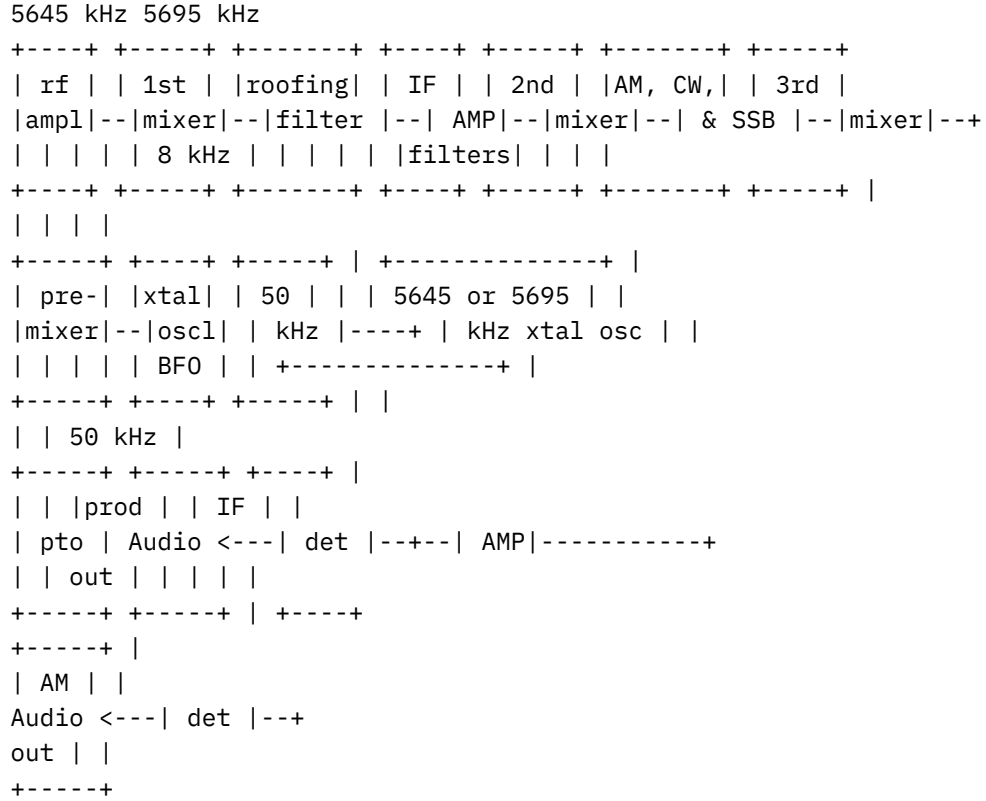
>Resolving SSB requires BFO injection at correct frequency. I've

You have it correct, but let me draw that out just to make it
more obvious for anyone else reading this. Here is a block
diagram for that portion of a Drake R4C:



There is a slight difference between how this works for AM and for CW or SSB.

For AM, the BFO is turned off and the 2nd mixer becomes an IF amplifier instead of a mixer.

The AM signal and filter are at 5645 kHz, and the injection frequency for the 3rd Mixer is 5695 kHz, to produce an output frequency of 50 kHz.

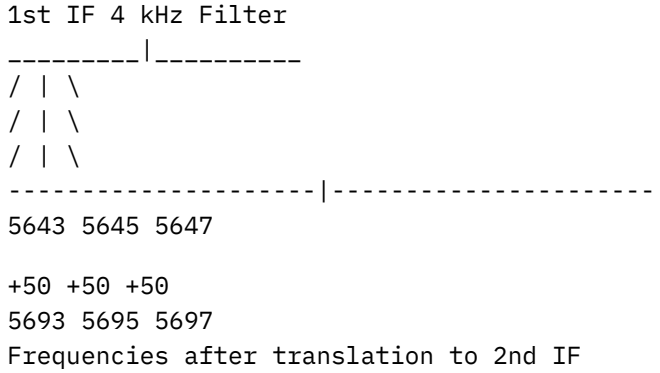
For SSB and CW the signal and filters are at 5695 kHz, and the injection frequency for the 3rd Mixer is 5645 kHz to produce a 50 kHz output. (Note that the filter frequency and injection frequency are swapped with that used for AM.)

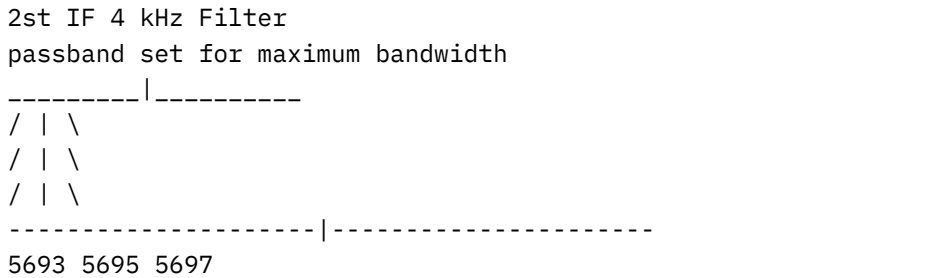
The location of the passband (in relation to the 1st IF) is changed varying the BFO frequency either side of 50 kHz (by about 3 kHz each side). This moves the 2nd IF and the 3rd IF, but not the product detector output because it is also generated by that same offset 50 kHz BFO.

Moving the 2nd IF moves a received signal to a different location in the passband of the 2nd IF filter. The output from the product detector, however, remains at the same frequency because the 3rd IF moved exactly the same amount and of course so did the BFO.

The BFO bandpass tuning knob is calibrated with among other marks, a line indicating the "center" frequency. When a CW signal is tuned to zero beat, the peak S-meter reading should happen when the bandpass tuning is exactly on that center frequency mark. That should also produce the lowest pitch sounding "whoosh" when no signal is tuned in. The actual tone that is produced is the difference between the 1st IF signal and the 5645 kHz xtal oscillator injected into the 3rd Mixer.

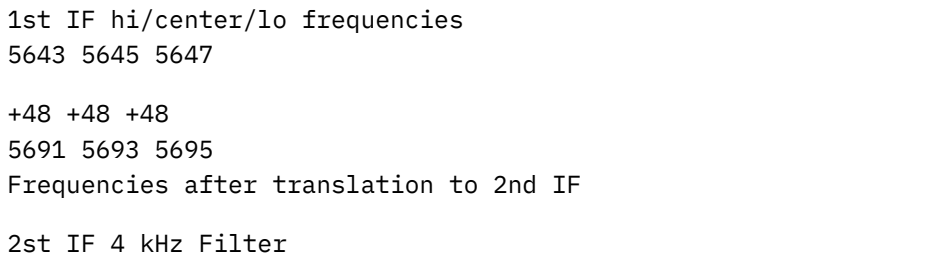
Now lets think about what could be changed. This example would be true for any two equal bandwidth filters, but I'm going to use 4 kHz wide filters as an example because it makes the numbers easy and obvious. In real life, 3 kHz filters might be more appropriate, though even narrower filters would work.





If those two filters were installed, and the BFO is tuned to exactly 50 kHz, the two filters would be exactly overlayed, and the total bandwidth would be a little less than 4 kHz.

Buy if we tuned the BFO instead to 48 kHz, we get something different though:



1st IF hi/center/lo frequencies
5643 5645 5647
+48 +48 +48
5691 5693 5695
Frequencies after translation to 2nd IF
2st IF 4 kHz Filter
passband set for 2 kHz bandwidth
5691 5693 5695

Low end High end already
cutoff by cutoff by 1st Filter
2nd Filter

One consideration in this scheme is that many filters do not have identical slopes on the high and low sides. This is very common with SSB filters that are designed as a matched pair using a common carrier frequency. If that type of filter is used the 2nd IF should be chosen (above or below the 1st IF frequency) to place the steepest skirts of each filter on opposite sides of the bandpass.

Also note that in the first example, giving 4 kHz bandwidth, the signal was located directly in the center of the bandpass... which is not useful for CW or SSB. The crystal controlled 3rd Mixer injection oscillator frequency must be made variable, by replacing the trimmer cap with a front panel controlled variable cap just large enough to move it over the same range as the BFO. Sideband selection would be made by moving the crystal oscillator frequency to one edge or the other of whatever bandwidth has been set. This has the disadvantage of changing the actual signal frequency to which the receiver is tuned (a

counter on the pre-mixer injection frequency no longer gives a
precise readout of the received signal's actual frequency offset
only by the injection frequency). Overcoming that would be
exceedingly difficult because it would involve mixing the 3rd
Mixer injection frequency with either the PTO or the band
selection oscillator... which would both be very difficult to do
considering that any feed through of the 3rd mixer signal into
the 1st Mixer would be a very serious problem.

>got the BFO also feeding a product detector. A 50 Khz signal is
>fed to the P.D. as well as the BFO signal. When passband tuning
>is at center the received carrier sits at 50 Khz in the 3nd IF
>chain and the BFO is at 50 Khz. This is correct to resolve SSB.

You've probably made a type there, and left out "not" before
"correct". That is correct to resolve AM or a zero beat, but
not SSB. Your following discussion is correct for SSB, which
requires the BFO, and thus the bandpass, to be offset to one
side of the received signal's carrier frequency.

>When passband tuning is (say) on USB, the BFO will be on (say)
>48.5 Khz. Then, received carrier (if there was one to receive,
>it's suppressed) sits at 48.5 Khz in the "50 Khz", 3nd IF chain.
>This is correct to resolve SSB, because the suppressed carrier
>sits there now. In fact, with this system, changing the BFO
>frequency has the effect of moving the signal across the filters
>passband, with BFO injection automatically tracking with the the
>sideband energy.

Exactly!

>Like I say, that I think describes Drake's passband tuning.
>Pretty neat. Of course, the frequency readout on your R4C
>dial shows the correct receive frequency, as the VFO does
>not change frequency. If I have it wrong, please let me know.
>Thanks.

You've got it. And you can see why a poor 1st IF filter causes
problems with blocking from adjacent strong signals. And how
that is still true even with a good filter if that strong adjacent
channel signal happens to be occupying the "other sideband" area
of the passband. One of the interesting modifications to the
Drake R4C is to provide switched filters at the 1st IF too, as
well as at the 2nd IF.

However, apparently a narrower 1st IF filter interferes with the
functioning of the noise blanker circuit. I'm not sure to what
degree, nor of exactly why. But there are some interesting
possibilities there too. The noise blanker's gate (as well as
all of it's amplification) comes after the filter. One very
interesting modification was done by Rob Frohne.

<http://www.wwc.edu/~frohro/R-4C/NoiseBlanker.htm>

This uses a Ten-Tec model 297 noise blanker modified to work in a Drake R4C. The Ten-Tec unit does not include the noise gate, and uses Motorola IC's for IF amplifiers that provide 120 dB of AGC action. Rob's method was to put the noise gate in front of the R4C's 1st IF filter, rather than behind it (and after the 1st IF amp and 3 transistor stages in the Noise Blanker itself, which is the way the Drake 4NB is arranged).

I'm not sure if the noise gate prior to the filter is more or less significant that the noise amplifier's need for transient response. Hence, while Rob's design appears to work much better than the old Drake design, I don't know if it is equally affected by the bandwidth of the 1st IF filter or not. I am definitely going to obtain a Ten-Tec noise blanker and install it in my R4C, but testing it with various filters is just too expensive, given that I don't need them otherwise. :-)

However, given your project... if your location is one where strong adjacent channel signals are common, you definitely want to go for the best filters possible early in the IF scheme. If your location is prone to shotgun noise, you'll also want to take a close look at the URL above (Rob does an *excellent* job of describing it) as a possible basis for an added noise blanker at a significantly lower cost that buying something like a Drake 4NB. (The Ten-Tec unit lists for $25 right now, plus it would require at least that much more in parts for the interface.)

Another URL you might want to look at is www.sherweng.com, where Rob Sherwood sells his mods for the Drake R4C and other interesting things. It's good info, plus a couple of his kits might actually be adaptable to your needs.

==========
Actually grid 1 and the cathode of the 6BE6 functions as a diode
detector for AM signals in versions of this circuit I have seen. Grid
1 functions as the anode. The audio is developed across a load
resistor in the grid (anode) circuit just like an ordinary diode
detector. For CW/SSB the audio is developed across a load resistor in
the plate circuit of the 6BE6.

Best Regards,

Ed

Source record: 33185

I have never seen an exploded view showing all of those small parts.

In addition to taking photos while disassembling, I sometimes make little sketches. I also do this when I have to unsolder several components to reach one buried one.

I also temporarily reinsert things where they belong, as I disassemble. For instance, as soon as the front panel comes off, I put the face panel screws back into their holes, with the correct washers. No confusion about what goes where, and you know exactly where to look when the time comes. Much better than scrabbling through 100 small parts that you tossed into a cat food can (or even worse, left scattered on your workbench).

When you have a number of little washers & whatnot on a long shaft, you can stick them in the correct order onto a length of masking tape as you remove them. When they are all off, fold the tape over and write a note with a marking pen about what they are. Or reassemble the washers & nuts on the shaft itself, if it's coming out all the way.

Regards,

Phil

# 2413. FS: National RCK Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-03-29 19:11:11 UTC
From: JRS <n3ab@fast.net>
Message-ID: <mtrb8v8f6lhgvlu4v77b2ab69u3do8hp9c@4ax.com>
Source record: 33186

I have for sale a National RCK receiver which I purchased years ago, but I never got around to restoring it. This appears to be a rack mount model and has a slide-on cover which covers both the top and the bottom of this unit. The panel above the radio holds a speaker, and the brackets that hold the receiver and speaker panel together have National emblems on them. Looks like it covers 200 to 400 kHz and 1.3 to 30 MHz. Overall physical condition of this radio is fair to good. It needs a good cleaning! Receiver looks complete. All of the knobs look original. Since I do not have a variac available, I did not try to power it up. It has been in storage for over 10 years, so the new owner may want to make some checks before any power is applied to it.

This radio is very heavy and I will not ship it. Buyer will need to either pick it up or I can meet somewhere within a reasonable driving distance of Allentown, PA. This will give the prospective buyer a good chance to carefully check this radio before purchasing.

A picture of it can be seen at:
http://www.users.fast.net/~n3ab/national1.jpg

More pictures are available by email. Asking $100.00. Cash, money order or cashiers check preferred. Please email me if you have questions. Thanks for reading.

I have a Signal/One CX7A without a power cord. I recently purchased the proper connector, and went to my user's manual to look at the schematic / pictorials on how it's wired ..... NO SCHEMATIC!

The wiring to the connector on the inside of the rig is fairly difficult to get to to see what goes where.....

Does anyone know how to wire the Cinch-type power connector (for 110 volt operation)?

Please reply direct to w8kzw@arrl.net. Graphics / jpg's are especially appreciated!!

Thanks,
Jeff

Anyone know if the older Oil Filled Caps are worth anything, used anymore or just plain trash? I have a few here I believe are of military vintage. IF they are useable, and anyone can use them and IF they can be shipped with out being prosecuted, then they're going to go for a small pittance. IF they are trash, then in the trash they shall go. I'm cleaning out my shack, shop and my workbench of all unneeded junk and inventory. Speaking of which, I do have a list of items up for sale, if you should be interested. If so, please request it, by direct E-Mail..... BUT I am wanting more so to know about the caps.

Thanks.

Hi..
I have a HW-101. I was listening to it and suddenly two resistors cooked along aith a cap. I replaced them and no bias or power out. . The power supply looks like it has two 2 watt resistors that appeared to have gotten heated..
Any ideas? This is the first Heathkit transceiver I have had.

Oil-filled caps of the metal and ceramic type seldom go bad. However,
the older ones may contain PCBs, which is a definite no-no. Newer
ones have 'No PCBs' printed on the can.

If they are of the non-PCB variety, you might want to give the values
and voltages.

Source record: 33098

Just a further note: PCB oil caps generally have a name like
pyranol. The manufacturer's were quite proud of the fact that
the oil was low flammability, and was chemically based on phenols.
Back in the '40s, "modern living through chemistry" was one of the
chemical mfr's mottos.

Secondly, PCB capacitors are very smelly. Even ones that show
now sign of leakage will curl your nose hairs with the whiff test.
PCB's have a sharp pungent chlorine like odor. Kind of a cross between
tempra (watercolor) paint and chlorox.

If they are PCB caps, please don't throw them in the trash! At least
once a year, most every trash collection service holds a toxic waste
collection day where they collect small quantities of any kind of toxic
waste no questions asked.... well, they do want to know what it is.

Thanks,

Chuck, WA3UQV

Yep, get out the voltmeter, and start looking for the HV. What happened is you had some electrolytics that were in desperate need of being reformed, and you just ran the radio. The caps shorted, and took out the resistors, possibly the rectifiers in the PS, and maybe a tube or two that was biased badly due to the whole mess.

In the future, you can often avoid this kind of mess (not always!) by applying voltage to each electrolytic cap through a 1.5K resistor for at least 15 minutes. Do this with filaments and HV OFF! The electrolytic caps use an aluminum oxide layer as their dielectric. Over time, about 2 years of disuse, the oxide layer dissolves in the electrolyte, and the cap becomes more and more leaky. If you apply the voltage with out current limit, POOF! the caps will boil and pop their seals. If you apply the current with a 1.5K 2W resistor in series, this limits the current, and allows the oxide layer to "reform" The capacitor is saved.

Hello,

I have for sale (2) Gonset radios both in working condition but have been sitting on the shelf awhile collecting dust. I have upgraded my shack to solid state and selling. Non-smoker ham who takes great care of equipment.

1) Gonset Communicator-IV 6-meter AM transceiver with assorted crystals (50.1 through 50.4 MHz). Unit is VFO receive and crystal transmit. Unit operates, includes manual but does not include a microphone. Asking $50.00 or best offer. I have used my Astatic D-104 with this radio (plug has to be a 1/4" three conductor type).

2) Gonset Communicator GC-105 2-meter AM transceiver with crystals. Includes microphone and manual. Radio is mint condition, asking $50.00 or best offer.

Contact Denis w1wv@attbi.com at 1-508-235-2012 (work tel.) if interested. Buyer will pay for shipping and insurance.

73,
Denis

Good morning all

I am selling this great old receiver from the very early days of radio. It was considered one of the premier ham receivers of its time. All original and working. Includes 5 sets of coils (very hard to find) as well as a copy of the owners manual. Cosmetics good, slight fading of the wasp logo. Looking for $500 / OBO or will trade towards an Icom 706MK2G. See http://pages.cthome.net/nord/Pilot.htm for pics.

You haven't lived then ;-)

The ones that I have seen that smell are rectangular cans that are
solder sealed, and have terminals that are rubber gasketed.
The leakage isn't visible, but the Pyranol's odor is unmistakable.

I have a few extra slugs for sale.
These are duplicates to my own set.
Which are you looking for?
Also, I have an extra bird.

I have for sale a very nice condition R-390A.
It is from the Motorola 14-PH-56 contract and has original
meters and covers. It is in nice working and cosmetic condition.
Asking $575.00 plus shipping. Continental US only.

Thanks,
Michael

Good day,

I have an HT-37 that I would like to hook up to a Dowkey, model DK60-G2C.
I have the AC version. I am ok with the connection to my Drake receiver.
Can anyone give me instructions for connecting to my HT-37 ? I would like
the dowkey to mute the receiver when I switch the transmitter to the mox
position. Any input would be appreciated. Thank you!

Source record: 33118

Dave,

I am not specifically familiar with the HT-37, but it, like many transmitters of the time, probably has an octal socket on the back. Check the schematic and you should find 2 normally-open relay contacts brought out to it. Use these to switch the 110 vac to the relay, and use the external contacts on the relay (if any) to the mute terminals on the Drake. If the relay does not have external contacts, you might have to parallel a small 110 vac relay (radio shack type) to do the muting of the receiver.
There may be additonal contacts available on the octal socket which may be used.

To keep down the cabling, you might be able to mount the relay to the transmitter's SO-239 by using some RF adapters; a double male or possibly an L adapter.

Hope this helps.

Greetings:

Everyone knows that the condition of radio equipment has a profound affect on its assessed value. As more radio equipment is traded over the Internet, greater reliance on condition descriptions is needed. The primary purpose of the Universal Radio Equipment Grading Standards (UREGS) is to help pin down a reliable grade, representing the true condition of equipment.

The UREGS are now available in both a shorter, easy to use form as well as a revised longer form on the www.UREGS.org web site.

The UREGS provide a suitable means of describing the condition of ANY radio equipment.

Traders are encouraged to check the new site and to use UREGS standards for grading manufactured or homebrew equipment.

You may also use the new web site to directly access the UREGS Team, regarding questions, suggestions, or to volunteer to help with the project in the future.

If you think of ways to make UREGS better, tell us!

Cheers,

The UREGS Team

Source record: 33125

Thanks Ron,

I guess this is where my confusion is: The schematic shows two of the terminals on the octal plug as being "relay contacts", and references leads coming from these two terminals going through the change over relay to an "external power source". Am I correct in hooking up the dowkey to the wall for A.C. then hooking the other contacts on the dowkey to these two terminals on the octal plug? I guess if I saw a breakdown of how the dowkey works and what power/signal is applied to each of its terminals, I would be able to figure out what to do. As it is, I am confused between the instructions for the dowkey and the schematic on the HT-37.
When powered, the dowkey closes, and mutes the receiver. It seems to me that the dowkey should be powered only when the transmitter is switched to mox. So would the AC to accomplish this come from the relay contacts on the transmitter? This is what the dowkey instructions lead me to believe. The dowkey instructions indicate two ways to power it.
A. taking the proper power from the accessory socket on the transmitter (usually controlled by the plate switch) or :
B. operating the relay with an auxiliary (possibly push-to-talk or vox controlled relay) switch.

It seems strange that you would power it from the wall, then the transmitter would switch that power off and on to mute or transmit. But what do I know, I'm just a wannabe electronics guy! Please let me know what you think. Thank you!

Dave

Source record: 33127
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

Sorry for the off-topic post, but I recently picked up a very restorable T-54 as part of an equipment package I recently purchased. The set is missing the speaker, but is otherwise complete and in good condition. I have not attempted to power it up. I would like to trade it for a good working Hickok 600A tube tester. I would possibly be interested other deals, but would prefer a trade rather than a sale.

As shipping would be expensive for both items, I would prefer to hand carry the equipment and complete the deal in person. I live in southwest Indiana and would be willing to travel up to 200 miles one-way to complete a deal.

If you are interested please e-mail me. Thanks in advance and 73,

Kevin, K9HX

Source record: 33128

Here is the HT-37 and dow-key hookup,
based on page 3 of the HT-37 manual:

The two solder tabs on the cylindrical shell of the Dow-Key
DK-60-G2C get energized with 120vac during transmit.
To accomplish this, run one wire directly from a wall
plug to one of the solder tabs. Run the second wire
from the wall plug to pin 3 of the octal plug on the HT-37.
Another wire, from pin 2 of the HT-37 octal plug then goes
to the other solder tab on the Dow-Key.

Ignore the open-frame relay contacts on the Dow-Key.

Pins 6 and 7 are available on the HT-37 octal plug for
receiver muting, depending on whether you need an open
or a grounded wire to mute the receiver.

73,
Ed

Sorry if this is off-topic post...but those repairing boatanchors may
be able to use this!
FS: DESOLDERING WORKSTATION
This is an A.P.E. (Automated Proeducts Equipment Corp.)
soldering/desol.dering workstation. It is in used but good condition.
Has vacuum and pressure, footswitch operated. Includes desoldering
tool with line and filter, has adjustable pressure & temperature.
There is an adjustable AC outlet on on the front panel into which you
can also plug a standard soldering iron (not included). Includes a
stand and holder for solder irons, sponge, wire brush. Also on the
front panel are connectors for "Thermtool" and "Cirkgrind Quikplate",
which are apparent plating and rework accesories for this work station
(not included). $150 + shipping. Please respond to
NOSPAMdt0124@comcast.net (and remove the NOSPAM from the address!)
Thanks!

# 2461. Digital Display for Collins S-Line Receivers FS

Newsgroup: rec.radio.amateur.boatanchors

From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <G1Zha.1411$4P1.123775@newsread2.prod.itd.earthlink.net>
Source record: 33134

I have for sale a very nice Grand Systems GD-6C Automatic Calculating
Digital Display.
There is no band switch on this one to limit its use. It follows you to all
ham bands and short wave frequencies.
This one is set to work with all S-Line receivers, but it can be made to
work with KWM-2s.
It comes with all interconnecting cables for the S-Line and all original
instructions. It does require a small wall wart for 500ma and 12 VDC
regulated which was lost during a move. This is a nice display and works
great. It is a plug and play unit. No mods required for the S-Line
receivers.
Price is $195 shipped in lower 48.
Thanks, Charlie Hugg, K5MBX CCA 307

It's not, or at least this isn't evidence of it. It's programmed in the
"alter only the bits that need altering" method.

Now if you found win3.11 in 9x, or 9x in NT, that'd be evidence of c/p
programming.

FOR SALE:

Yaesu FT-101EE Transceiver in immaculate condition.
Looks unbelievably good for its age.
Comes with the SP-101 speaker, original manual.
Very clean inside and out. No dents or scratches.
Excellent working condition.
All in top notch shape, even has the original clear plastic protective
cover on the
front panel.
Has 260 watts p.e.p. input on SSB and CW, plus 50 watts AM.

Full output on all bands 160 - 10m plus 11m receive crystal. Comes
with
the AC
power cable and I have the optional DC cable available.

This classic tube and solid state hybrid rig has a
fantastic reputation and has many extra features.
Also, I have available the MFJ LSP-520 BX speech processor
which is already wired for this rig and ready to plug in and go.

Built-in power supplies for 115V (adjustable AC voltage source)
and 13.8V DC.

FT-101EE, AC, manual $245.00
SP-101 speaker (2 available) $50.00 each
DC power cable $19.00
MFJ LSP-520 BX Logarithmic Speech Processor $45.00

All of the above including one speaker for $329.00 plus shipping

FOR SALE:

Yaesu FC-901 Antenna Tuner. Goes with the FT-101ZD or
FT-901DM series rigs.
Good working condition. Unmodified. Has a few marks on the paintwork,
but will clean up nicely. Comes with the manual.

Selling for $175.00 plus shipping.

Fox Fire

When antiwar demonstrators gathered outside the Fox News building in Manhattan, the network's outdoor news zipper replaced its headlines with taunts:

"War protester auditions here today. . . . Thanks for coming!" And: "How do you keep a war protester in suspense? Ignore them." And: "Attention protesters: The Michael Moore Fan Club meets Thursday at a phone booth at Sixth Avenue and 50th Street."

Unfair and unbalanced? "I thought I'd have some fun with it," says Fox zipper-writer Marvin Himelfarb, a former Hollywood screenwriter. "I just couldn't resist."

# 2484. Re: S-38B BFO Alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-02 02:05:35 UTC
From: Steven Sostrom <srs@eecs.umich.edu>
Message-ID: <jzria.2689$XR3.81657@news.itd.umich.edu>
Source record: 33207

I too am having trouble with BFO alignment on my Hallicrafters S38C.
According to the Hallicrafters owners manual, "For correct BFO operation,
vary the coupling between lead E and pins 4 and 8 of the 12SG7 tube for a
maximim beat note." That mainly makes the BFO stronger.

I'm pretty sure that I have aligned my IF properly, but the BFO makes a very
high pitch beating against the generator that aligned it.

Should I align it so that the BFO is right and hope the rest of the radio
works well? Maybe I didn't align the IF correctly? The sensitivity on A.M.
is much better that it was before I started.

Steve, Ypsilanti, MI

# 2487. capacitor questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-02 16:31:49 UTC
From: "kw3u@warwick.net" <kw3u@warwick.net>
Message-ID: <3E8B1075.2040500@warwick.net>
Source record: 33210

Well I've picked up a few BA's(dx40,dx60,eico720 etc) and working on the dx40 first Ive ordered the 40uf 450v filter caps for it. my question on replacing caps is how can I tell if it is an electrolytic? the silver can or large 40ufs are a no brainer, but the others, some tubular types at 2uf - 200v with a banded end? also is it ok to replace a cap like that with any cap that is the right uf & voltage rating but not an elect? If I use my capactance tester it seems happy to read either type(polarized or non) so I'm curious as to what I can and can't do in replacing these critters. If it really doesnt matter, it might be fun to series/parallel caps to obtain proper cap/voltage from el junkbox and hamfest parts.
I enjoyed some threads here on capactors, ie throw all the old ones out, test and replace bad, etc. good stuff.
Thanks guys 73 Jim kw3u

---

On non-electrolytic caps with a banded end, the band indicates the outside foil. The purpose is so you can connect the outside foil to ground, thereby shielding the inner foil from stray pickup.

As to your second question, I am sure you can replace an electrolytic with a non-electrolytic in any application. If there is an exception I would like to know of it.

Source record: 33212

Test it like a diode. Use a bench supply (12 vdc?) and a resistor in series with the cap. If it is electrolytic it will show a much lower voltage with reverse polarity. Play with the resistor value starting with large values.

That is a bit misleading, the outside foil does not always go to
ground. That end usually connects to the lowest impedance source
which may or may not be ground. On modern capacitors you probably
won't find a banded end, so it makes no difference.

Hi,

I have a question for somone who owns a Clipperton L.

How deep is the dip when you tune your amp into a load on the 160 Meter band.

I get almost no dip, regardless of the position of the loading and tune controls.

Please reply via email.

Thanks!!

Sorry if this is off-topic post...but those repairing boatanchors may
be able to use this!
FS: DESOLDERING WORKSTATION
This is an A.P.E. (Automated Proeducts Equipment Corp.)
soldering/desol.dering workstation. It is in used but good condition.
Has vacuum and pressure, footswitch operated. Includes desoldering
tool with line and filter, has adjustable pressure & temperature.
There is an adjustable AC outlet on on the front panel into which you
can also plug a standard soldering iron (not included). Includes a
stand and holder for solder irons, sponge, wire brush. Also on the
front panel are connectors for "Thermtool" and "Cirkgrind Quikplate",
which are apparent plating and rework accesories for this work station
(not included). $150 + shipping. Please respond to
NOSPAMdt0124@comcast.net (and remove the NOSPAM from the address!)
Thanks!

# 2497. Re: capacitor questions

Date: 2003-04-03 16:06:34 UTC
From: Phil Nelson <philnelson@antiqueradio.orgNOSPAM>
Message-ID: <e_Yia.7156$4P1.559168@newsread2.prod.itd.earthlink.net>
Source record: 33220

> how can I tell if it is an electrolytic?

An electrolytic will have positive/negative markings.

On old multi-capacitor metal cans whose can connects to ground, the values of the positive leads are often stamped or printed on the outside of the can and keyed to symbols (square, triangle, semicircle, or nothing) on the bottom of the can by each lead. For instance, the "triangle" lead under the can will be identified as 20mfd, or whatever, on the outside. On this type of can, the can itself serves as the common negative for the capacitors inside. One or more of the can's twist lugs will be soldered to the chassis. Some cans will be isolated from the chassis and then you would have a different negative connection.

On old multi-capacitor cardboard containers, the positive leads are often identified by color (20mfd Red, etc.). On this type of container, the common ground is typically a black wire.

Of course, you can also have a container with only one electrolytic inside. An older single electrolytic will usually have clear plus and/or minus markings on its case. A modern single electrolytic will typically have a band of -> -> symbols running along its length to point to the negative lead.

If you don't want to remove the innards from an old electrolytic can and "restuff" it by hiding new single electrolytics inside, you can simply disconnect its leads and wire new single electrolytics under the chassis.

More along these lines in the article at http://antiqueradio.org/recap.htm .

> at 2uf - 200v with a banded end? also is it ok to replace a cap like
> that with any cap that is the right uf & voltage rating but not an elect?

Yes. Modern unpolarized caps -- at least the ones I use -- don't have the band ("outer foil") marking and it seems to make no difference which way they are connected.

> fun to series/parallel caps to obtain proper cap/voltage from el junkbox

No problem as long as your junkbox parts test good on a checker that applies the right voltage. It does no harm to exceed the capacitance rating somewhat. For instance, it's fine to parallel two 33mfd caps to replace a 60mfd.

Phil

# 2498. Gonset G66B help needed PLEASE!!!!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-03 17:05:54 UTC
From: Martyn <martyna@direcway.com>
Message-ID: <tRZia.60843$NV.1408950@news.direcpc.com>
Source record: 33221

Hi There
I have just received a very nice Gonset G-66B receiver and matching power supply with built in speaker.
Problem..... I have no power lead so I cant use it!!!
Now the power connecter has 12 pins and I know I am capable of making up a lead if only I knew where the power went (to what pins)
Can any one assist me here please as I would really like to start enjoying the rig.
Many Thanks
Martyn

Vintage Coils FS

selection of coils by 'Raymart.
ribberd formers, various windings
11 x 6 pin types with extra regen winding
6 x 4 pin types ae or osc usage
plus 1 x 6 pin base, 2 x 4 pin base, 1 x 5 pin base(4 pin coil fits
though)
1 x vintage on/off switch
2 x variable caps,high grade, probably 250pf +-
plus info sheet.

A schematic can be foound at the BAMA site. I found both GIF and PDF files. However, the schematic I looked at had an octal, male, plug on the receiver, not a 12 pin (Jones?) connector, so there may be version differences.

In any case, schematics are available awaiting your search homework.

Don

## 2502. FS:R-390A

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <v90v7lj0pv04c1@corp.supernews.com>
Source record: 33009

FS: I have some estate stuff I just got. Some of it has been turned on to verify operation (that is isn't dead) and some hasn't. It is as follows:

MD-239 RTTY Keyer unit for T-368 transmitter. This sits on top of the transmitter next to the TN-339 antenna tuner. It looks good and has a cable with it, no manual, $175.

CV-116/URR RTTY dual diversity converter that goes in the GRC-26D shelter with the T-368 and R-390A receivers. $135.

R-45/ARR-7 Hallicrafters receiver, a military copy of the SX-25 (or SX-28, I can't remember), has cabinet, $135.

CV-31D/TRA dual diversity RTTY converter for earlier versions of the GRC-26 series radio centers, $125.

Hammarlund SP-600JX receiver. This is an original black faced version, appears all original, it's alive, $300.

RCA AR-88 general coverage receiver, works, in what appears as original cabinet and knobs, unmodified, $385.

Eldico SBA-1 SSB converter for receivers with 455 IF, has built-in notch filter, noise blanker, appears very nice and clean, w/ manual, $385.

Anyone interested, email me or call me at (979) 693-1461 eves and wknds.

Complete GRC-19 system, R-392, T-195, rack, speaker, mic., and cables.
Have 50 Amp supply (USMC) power supply for $100 additional. Currently
on the air. Pick-up in suburban MD/DC/NoVA area. $500

# 2538. FS:NIB GF/RU Navy Radio System

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-06 20:28:53 UTC
From: K3HVG <jeepp@erols.com>
Message-ID: <3E908E05.1F2FA548@erols.com>
Source record: 33011

I have a new/unused (yes.... new!) GF-12/RU-17 Navy radio system. With a few exceptions, all units are in their original cartons. The system includes the receiver, transmitter, racks, dynamotor, dynamotor base, all coils sets (both rx and tx), rec control box, tx control box, second cockpit control box, remote bandswitch, rec. tuning unit, antenna relay unit, junction box and mount, all connectors and flex cable terminations, spare tube set, all coil storage containers, a phantom antenna (I think), tuning placards, and a book. This equipment was purchased, new, in 1948, put in storage and never wired up and/or put on the air. This set is truly vintage and of exquisite museum quality.
$750 or trades for vintage AM equipment, esp. military.
Thanks.

Source record: 33014

I acquired an Electro Voice 619 Low Impedence Microphone.
I have never had one before and was wondering if this mic is compatable with
the:
Heath HW-101
Swan Transceivers..
Viking 2 (with PTT)
It has been sitting around for awhile and was rescued from "cleaning day".
It is wired with a stereo plug.
I had been using the D-104 on some of the rigs but they are "high impedence"
as I recall.
Any help appreciated. Thank you for reading.

# 2544. Series diodes -- equalizing needed?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-06 22:46:41 UTC
From: snarflemike@yahoo.com
Message-ID: <20619edc.0304061446.2a6cbdac@posting.google.com>
Source record: 33017
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

In the "old days" when power supply diodes were used in series for higher voltage capacity, resistors and capacitors were used across each diode to equalize voltages. I've heard that this is no longer necessary, because modern diodes have controlled reverse breakdown a-la Zeners. So, is equalizing needed these days or not? If not, does that cover all typical late-model diodes that might turn up surplus (normal 1N4xxx, fast-recovery types, etc)?

Here's hoping it's true!

73,
Mike, KK6GM

# 2545. FS: Johnson Ranger II, Altec studio mike, Modulation monitor.

I know this was the usual practice when 'top hat' type SI rectifiers
were used. Many years ago I built a linear supply using 1N4007's and
I did parallel each diode with a 470k 1/2 wat resistor and a .001 1000v
disk capacitor. I don't know if this was necessary or not, but the supply
worked just fine. I also used twice as many diodes as necessary (the
transformer
was about 2800-0-2800 and I used 10 diodes in each leg of the fw rectifier).
The filter cap used ten 330uf 450v caps in series.

Actually, the equalizing resistors is still a good idea, and still very
much needed with the 1N400X series. All ratings are going to vary a bit,
and vary even more if you mix manufactures of the diodes within your stack.
I have never ran the equalizing capacitors, as they seem to cause problems
more often than curing them, but the resistors are very highly recommended.
Controlled breakdown? You don't want to be anywhere near that part of the
operating curve.

Though, with the HP meter it probably wouldn't matter, be careful
with the old style round pin cords. There were competing standards
that switched the neutral and hot pins.

My approach is/was to assume that at least one diode would go into reverse breakdown and I added at least one extra diode in the string. I have used that approach
a few times and have never had a failure.

Good luck.

Source record: 33032

The capacitors are there for transient protection and not steady state voltage equalization.

And yes, the more diodes the better to increase the cushion in terms of voltage rating. Similarly, using a higher current rating than necessary is a good idea too. For a linear, going from a 1A diode to a 3A diode costs pennies and will pay for itself in the long run.

## 2559. ? R-392/URR Solid state replacement

The advice that "equalizing" components are not needed has been in ARRL Handbooks for several years now. A few years ago, someone asked this question to my monthly RadCom column, so I contacted the original author for more details. Also it has been discussed several times on the AMPS mailing-list (amps@contesting.com).

The need for equalizing components is history - literally. It all began because early silicon power rectifiers could easily fail by reverse breakdown, causing a destructive arc across the wafer. The diode would fail short-circuit, so if one diode in a series string were to fail, it would place more inverse voltage across the other diodes and the whole string could 'unzip'. At first these diodes were quite expensive, and it was unusual to find more than 400V PIV, so manufacturers did not build in much extra capability to withstand a mains voltage surge at the wrong part of the cycle. Instead they relied on equalizing Rs and Cs to share the inverse voltage along the whole string.

That has changed, in three major ways:

1. All modern rectifier diodes have an avalanche ("zener-like") reverse breakdown characteristic

2. Peak inverse voltages can be much higher - 1000V is routine (1N4007, 1N5408 etc)

3. They are now "as cheap as chips".

The avalanche breakdown characteristic means that if a 1000V PIV diode does break down, it acts like a "1000V zener" (not a short) so it doesn't stress the other components anything like so much. If it's part of a series string of diodes, the power dissipation during breakdown is limited by the reverse leakage current of the other diodes that have *not* failed, so a reverse avalanche breakdown is usually completely recoverable - you'll never even know that it happened.

All of these factors put together mean that it isn't necessary to use "equalizing" Rs and Cs any more. It's actually cheaper to use more diodes in series, so that in Gudmundur's words you never come anywhere near reverse breakdown. However, Gudmundur is also right to recommend *not* mixing diodes from different sources in a series string. If you care about reliability, then use new, branded diodes straight off the bandolier from the factory. These will be as close as possible to identical in reverse leakage, so they will be self-equalizing without any outside help.

One final point is that so-called "equalizing" components can cause more trouble than they're worth. If they are not rated to withstand more voltage than the diodes themselves, and if they don't remain closely matched in value through the entire lifetime of the equipment, they can have the opposite effect to what they're intended for! These days, it's actually cheaper to use additional diodes.

That's why the modern approach is not to use equalizing components. In "postmodern" power supplies, capacitors across diodes are coming back, but as part of an R-C snubber network to reduce spikes conducted back into the mains... which is a quite different motivation.

This is absolutely true, but don't forget to add NE-2 lamps with series
resistors across each diode. The actual transient suppression you get is
minimal, but it sure helps find the problem when a diode goes open.

Cross-posted to: rec.radio.amateur.boatanchors,sci.electronics.repair

[Crossposted to both rec.radio.amateur.boatanchors and
sci.electronics.repair, because applicable in both]

A few years back, I came into possession of a working HP oscilloscope
Model 120B, as it names itself. A fully hollow-state oscilloscope, built
like a tank, and certainly heavy enough to be a boatanchor.

Now when I said working, what I really meant is mostly working. The
trigger-select knob is dirty, or at least doesn't make contact half the
time, and the trigger circuit itself might need some tender loving care as
well, but the knob needs attention first. Also, it really needs a complete
calibration, but well, wouldn't you if you were 50 years old.

So what I'm looking for: a service manual and/or owner's manual for an HP
120B Oscilloscope. Preferably for less than the scope cost me, ie, under
$20 or so. Copies or scanned are fine, as long as legible including
diagrams.

If I can't get that, I'd like to know which sizes hex wrench I should be
using to remove the knobs from the various axles on the front panel. The
ones I have (metric) seem not to be adequate, would I have to get imperial
ones? Which sizes? (I spotted at least two different sizes in main knob/
sens. adjust things)

Thanks,

Jasper

You need English, whatever hex wrenches.

Unless you really want to restore this for nostalgia or something, just clean up the controls, reseat the tubes to clean the contacts, and be happy. It's probably not worth spending much on a manual.

Well, yeah, but I *like* tubes! Besides, it's even fairly adequate for my
modest needs in oscilloscopy. It will show signals up to a MHz easily, and
up to 2 or 3 without too much trouble. If a manual will allow me to
calibrate it (using some stuff I can probably borrow from a friend) such
that it's got vaguely accurate voltage scales, time scales, and
calibration pattern generator, that would add some value, though.

On closer examination I see that equalizing was recommended last in
the 1994 Handbook, while it is no longer recommended starting in 1995.

Thanks for the great information. I found the comment about the
equalizing resistors changing over time and making things worse rather
than better especially interesting!

26A7GT.

There is a resistor between the audio output transformer (output
of V608) and input of V606, R629, that must be removed for
proper operation with the DuBrow or other "official" R-392
solid state audio modules.

The +'s indicate the positive terminal, and -'s indicate a negative
terminal.

Ground might be either of them.

---

The original question about capacitors with a band on one end was about non-electrolytics. On those, the band indicates the outer foil, which can be used as a shield if desired. In the old days of vacuum tubes and high impedance signals, this shielding effect could have been quite important. Back then there were lots of sources of hum which could be coupled into audio circuits especially. With today's solid state circuitry and very well filtered and regulated power supplies, the chance of hum pickup is greatly reduced.

With regard to electrolytics, don't confuse the "polarity" with the "ground". Depending on the circuit, either positive or negative could be connected to ground, or to any other point for that matter. In the case of the ordinary aluminum-type electrolytics, the negative side is almost always the outer case. I say "almost" because some manufacturer might decide to make one the opposite for some reason, but I've never seen one. I don't know if it's even physically possible, given the chemistry involved.

To add to the nitpicking..... The - end of the cap goes to the more negative voltage in a circuit, which may not be "ground."

I have been asked by an area man to help appraise the value
of his late father's amateur radio gear. The collection of gear
includes the following of old radio tubes:

2pcs Eimac 250T (one marked VT-130)
2pcs Westinghouse JAN-CWL-861 triodes - dated Dec. 1944
1pc. Westinghouse U.S.N CWL-803 - dated March 19, 1942
1pc. RCA JAN-CRC-803 (VT-106)

Any idea how I can go about assigning a fair market value for tax
purposes to these items (he plans to donate them to a college
radio club that I am affiliated with)?

Thanks and 73 de Mike, W4EF.....

FS Atlas Model 220CS AC Console for Atlas 210/215s. This is the one with Speaker and AC Power Supply. Schematic of the PS is included. The Console looks almost new. A few scuffs, but the cleanest one I have seen. It works good. There is a slight hum in the speaker. Price is $95. Thanks, Charlie Hugg, K5MBX

Source record: 33064

The outer case on an aluminum electrolytic cap is just a
case. The guts are a rolled up sandwich of aluminum, and
electrolyte soaked mesh.

I have used aluminum cased electrolytics that had both a
plus, and a minus terminal, and a floating aluminum case.
(I nearly got killed by one, too! When the floating case
became the positive terminal.)

-Chuck, WA3UQV

Bill, W7TI wrote:

None of these are worth much, probably < $10 each.

But for due dilligence, you could do a search on eBay amoung the
completed items, and see what similar items have sold for. They
maintain history for about 30 days or so.

The vast majority of electrolytics have the negative lead connected to the case, but as you point out, they don't *have* to be done that way. Thanks for the clarification.

I have a Knight Kit star roamer that has a loud squeal that is not controlled by the volume control. it is loud with the volume turned all the way down. I have already replaced all the electrolytic caps and checked the wiring against the diagram every thing seems ok, so I guess the problem might be a bad disk capacitor. What stage would this problem most likely occur in? The converter, IF amp, Audio amp or the Audio output.
Edward Lewis KQ6DX

Source record: 33075

Does the condition change if the RF gain or volume control is turned down? It is probably unwanted feedback.

In 2 different receivers I bought on eBay in the past 6 months, tubes had been replaced with "hotter" ones that that were not appropriate to the stage, and which caused IF feedback.

Don

# 2605. FS: National RCK Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-10 00:40:33 UTC
From: JRS <n3ab@fast.net>
Message-ID: <5bf99vcs0oq7bkcps9qgq2cv2pjuckno5u@4ax.com>
Source record: 33078

I have for sale a National RCK receiver which I purchased years ago, but I never got around to restoring it. This appears to be a rack mount model and has a slide-on cover which covers both the top and the bottom of this unit. The panel above the radio holds a speaker, and the brackets that hold the receiver and speaker panel together have National emblems on them. Looks like it covers 200 to 400 kHz and 1.3 to 30 MHz. Overall physical condition of this radio is fair to good. It needs a good cleaning! Receiver looks complete. All of the knobs look original. Since I do not have a variac available, I did not try to power it up. It has been in storage for over 10 years, so the new owner may want to make some checks before any power is applied to it.

This radio is very heavy and I will not ship it. Buyer will need to either pick it up or I can meet somewhere within a reasonable driving distance of Allentown, PA. This will give the prospective buyer a good chance to carefully check this radio before purchasing.

A picture of it can be seen at:
http://www.users.fast.net/~n3ab/national1.jpg

More pictures are available by email. Asking $100.00. Cash, money order or cashiers check preferred. Please email me if you have questions. Thanks for reading.

From: Radioted <tedm@xtra.co.nz>
Message-ID: <GLala.60173$jE3.1294316@news.xtra.co.nz>
Source record: 33084

Good evening everyone, and thanks for reading this.....

I have a number of obsolete HP house numbered IC's that that I would like to identify.... I think they are BCD decoder / driver chips for Nixie displays.... but have no idea of pinouts etc...

They are numbered 1820-0092

Are they the same or similar to the old TTL 7441 / 74141 chips.

If they are they will find their way into a digital readout for a Racal RA6217....
Any info most gratefully received
Many thanks for your time and trouble

Edward,
Sounds like it could be a microphonic tube, a tube that causes feedback from the vibrations of the speaker. The suggestion to pull tubes will work, but what I do is tap each tube with the eraser end of a pencil while the radio is on. You will know when you find the microphonic tube. Good hunting. The key is it can not be turned down by the volume control. The oscillation problem is in the AF output stage and associated components. Jack

NO, no good
You need Hi a Z element microphone. "High" impedance for tube circuits like
COLLINS, DRAKE, HEATH, Driftronix

Heath HW's, SB's, are Hi-Z into a of a 6GH8 with a 100K grid leak .
A EV-719, D-104, and Turner 254 "Ceramic's" is more suited
See if someone will swap you a 719 element
"the shells mics are exactly the same"
On the SB/HW-101 change the grid leak resistor to 500K and use a 6CQ8 for
more mic gain.

Can anyone highlight me on these solid state 6AU6 tubes??
I bought a Ranger that has one in it. I dont understand why its called solid state...it's about the same size as a regular 6AU6 tube?????

I dont dare change back to a regular 6AU6 tube becuz the circuit doesnt have that screen resistor or the OA2 regulator tube.

I sure like to hear from someone that can tell me the correct pin readout on these Sartori 6AU6 tubes....do they have filiments or what??

tnx Jack K8BVJ k8bvj@arrl.net

Source record: 32952

The Sartori solid state tube replacements for the Drake line,
and the Tubester solid state tube replacements for the Collins S/Line
were based on high voltage FET's. They are intended to replace
the tubes in a particular circuit. It should be possible
to replace the original tube. The pin-outs are the same.

In a Ranger, a common mod is to move the location of the voltage
regulator tube and associated dropping resistor out of the VFO
encloseure,
to reduce heat-induced drift. Your Ranger may have
a power Zener diode feeding the screen voltage for the VFO tube.

Is that labeled as a "SAU6"? That would be one of Howard
Sartori's tubesters. They are solid state replacements for
vacuum tubes. A number of models (such as SBA6, SEJ7, and SBE6)
were made.

Teledyne's Fetrons were another attempt at directly replacing
tubes with transistors. These were originally used mostly
in the telephone industry, but since 12AX7's and 12AU7's were
also popular in the audio business, they ended up in a lot
of guitar amplifiers too!

If you want to actually use the Ranger, you are probably best
off to leave the tubester in it! Less heat, no microphonics, no
hum, and it will likely last forever. If you want to restore
the rig to be a collectors item... find the parts and send me
the tubester.

Hey Ed:
The problem is, indeed, in the audio stage (AFTER the volume control).
Start gently tapping around with an insulated screwdriver handle. Suspect
grounds and poor solder joints FIRST (including the volume control pot
itself.) Most of these kinds of failures are intermittant; tapping around
can work wonders in finding the source of the problem.

The audio tube itself can be the problem. Disk capacitors would be last on
the list of troublemakers for this problem.

This is a solid-state receiver coupler from the '70-'80s by my guess. It uses discrete components (no ICs) and, in typical TMC fashion, is built like a tank. Works 100% on HF; don't know high frequency limit. Has 1 BNC in and 8 BNC out. Model AMC23/50, serial number 2268. Made by TMC(Canada) Ltd. 110VAC. Line cord jacket is torn at strain relief, but the wires inside are fine; I would replace it. US$80 delivered lower 48; happy to ship anywhere else for actual shipping costs. Call 919.846.6117 or email to discuss.

Hi Joe,

How do you know they need replacing? Are they
blown up, or are you just in the renewal mood? ;-)

The reason I ask, is caps like these generally reform
very nicely. Easiest way of performing that feat with
an HP-23 is to put a 20W light bulb in series with the input
cord, and let the power supply work things out, unloaded.
In about an hour, the light bulb should be dimmed, and the caps
should be as good as new, that is if they weren't already ruined.

Gil

# 2649. Re: HP-23 caps...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-13 12:33:54 UTC
From: Chuck Harris <cfharris@erols.com>
Message-ID: <b7bllh$6un$1@bob.news.rcn.net>
Source record: 32972

Hi Josuha,

I guess the radio didn't hit the trash after all! There are no
100 ohm 2 W resistors in the HP-23 power supply, but there are
5, 100K 2 W resistors that are used as bleeders to help keep
you from killing yourself from charged caps when the power is turned
off.

What kind of test equipment to you have access to? If you have a
voltmeter that is capable of safely measuring 1KV, you can troubleshoot
this supply.

First, unplug the supply from the radio, and the powerline. Attach
a cliplead between pins 9 and 10 on the 11 pin socket on the chassis
of the power supply. Flip the supply's on/off switch to off.

Now, plug in the supply, and flip the on/off switch to on. What
happens? If no smoke, or loud humming, measure the voltage across each
C1 and C2. (they should have a pair of 100K resistors across their
terminals. They should have about 400VDC across them. If the voltage
is not 400V +/- 25V, turn things off.

If the above is ok, then we should check the Receiver supply, pin 3
of the power plug for 300V.

Then, pin 1 of the power plug for -150V.

If you get these voltages, your supply is probably ok. Turn power
off, and check the cardboard covers of the caps for warmth. They
should be room temperature.

-Chuck

A schematic of the powersupply, and the radio can be found on line
at www.bama.com

# 2650. Heath Universal Supply for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-13 12:39:09 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <NTcma.21703$ey1.1906048@newsread1.prod.itd.earthlink.net>
Source record: 32973

From a friends estate.
This supply looks like the size of a HP-23 supply, and has the typical
supply voltages output for B+, screen and etc.
The widow would like 40 for this.
Let me know and I will pass your name along.

--
Best Regards, Frank, KG9H

If I recall, you mentioned that the volume control had no effect. That leaves you 3 stages of audio amplification (two tubes) that you need to check - V3A, V3B and V4. Replace each of these tubes first, and if there is no affect, start checking voltages in these stages.

# 2652. WTB Collins Pointer knob and P.A. Tuning knob for KWM-2A

Hi,

What reccomendations do you have for a replacement 120 VAC muffin 4 inch fan (3.75 inch center to center mounting holes) for my Clipperton L amp?

I seek something that is quiet!

Please reply by email.

Thanks, Bob

I have a rebuilt Hammarlund HQ-100 that has developed a very loud hum. I replaced the 12AX7 tube (with a 12AU7, all I had) but it did not fix it.

The filter capacitor has been recently replaced, otherwise I would suspect it.

Any ideas?

# 2658. FS: Swan, Heathkit, Morrow, Eico, Knight Original Manuals

Set of FOUR brand new, GENUINE rubber feet from BIRD for the BIRD wattmeters
like 43, 4431, 4304, 4308, 4410, etc.
Replace those missing or damaged feet you have now.

These are the actual rubber feet made by BIRD for these meters.
These feet fit (press in fit) on the bottom of the meter case.

See http://radiodan.com/bird/images/birdfeet.jpg

$5 per set of four including shipping to any USA address. (I can ship
anywhere in the world at additional cost)
PayPal, Cash, Checks, Money Orders

We buy BIRD
We sell new and used BIRD

# 2668. Heathkit SB-303 problem - Please Help !

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-14 03:54:23 UTC
From: p34901@hotmail.com
Message-ID: <694df9e0.0304131954.21649b4f@posting.google.com>
Source record: 32991

Hi,

I am desperately reaching out for help on my recently acquired Heathkit SB-303. First of all, Thanks in advance for reading my posting... I've just bought a dead SB-303 a couple of days ago. Acutally the seller said it is working with a bit of hum but when I switched it on at home, there is absolutely no sound and no s-meter movement... But the lights (main tunning and s-meter) are on. I don't have much knowledge on electronics but curiosity forced me to open the cabinet and troubleshoot, hoping that it is a simple fix. I noticed that despite its age the circuit is modularized by a series of boards. Using my common sense and logical thinking I started with power supply board, checking enough voltage/power is fed to each board. I measured the voltage using my multimeter on the rear board (power supply, BFO, Calibrator, Circuit board). There are two sets of 6 soldering pins (each pin with a label) on this board and I am getting the following voltage readings:

The right 6 pins set:
(label=actual voltage measured)
AC= 53.6V AC
-10 = -10.5 V DC(Green line)
+35 = +25.5 V DC(Red line)

The left pins set starting with 35 kHz & 100 kHz:
(label=actual voltage measured)
-10 = no voltage (yellow line)
+15 = no voltage (orange line)

Obviously, I suspect that this is the source of the problem - no voltage(power) being fed to/from this section (orange and yello lines) of the board and therefore the rest of the circuit is affected ? I measure the orange line anywhere and there is no voltage. Any idea ? Anyone with the same experience ? Thanks again and I would be grateful to anyone with any repair suggestions/instructions... I just keep thinking that someone out there had exactly the same problem and knows the answer.

Peter,

# 2679. Old BC and SW Zenith radio

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-15 01:00:20 UTC
From: oceanradio@aol.com
Message-ID: <20030414210020.20222.00001019@mb-fu.aol.com>
Source record: 32902

I met an old old Zenith radio over the weekend, one I'd have guessed came from the 30's but there was a reference inside on the chassis to Television so maybe it was later. Anyway, all the tubes were removed so I couldn't begin to troubleshoot it. I didn't find anything showing the tube types by socket. Anybody got a lead on where I could find a list of tubes or schematic for a very old Zenith?
I found the number 54628463 on a plate on the chassis.
Tnx,
John K4XC

Go to the Oracle and find the model number:
http://www.oldradios.com/reference/zenith.htm

Then go to Nostalgia Air for the schematic:
http://www.nostalgiaair.org

They've been having some problems in the last day or two so be patient.

Then go to:
http://www.antiqueradio.org/begin.htm
and read about replacing the paper caps so you don't burn it up trying
to apply power. Remember this is domestic gear, not ham or commercial.

And feel welcome to the rec.antiques.radio+phono group for additional info.

Regards,
Bill WX4A

I aquired a Heath SB401 which appears to be repairable but the tuning dial is shattered. The dial looks identical to the one on my SB300 so I suspect anything from the SB series would work. Thanks for looking.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 20th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society

It was common for radios in the 1930s to have "television" outputs; for a mechanical tv receiver! You attached your spinning disk receiver to that port, and watched the "telecasts" that took place throughout the 1930s, and even in the late 20s. Best of luck restoring your receiver.

Mike

This classic Heathkit HF amp is in very good condition cosmetically. 8/10
condition. Some minor chips around the edge of the front panel caused from
removing the outer cabinet.
This amp has:
Full output from two 3-500 tubes
Harbach soft-key mod for use with modern solid-state transceivers
Harbach meter board replacement with meter protection and heavy duty diodes
AG6K (Rich Measures) mods
New feet

Asking $525.00 plus professional boxing (professional foam packing to assure
it won't arrive broken) and shipping/insurance costs.

As a matter of fact I did a recent test of the tubes in an S-85 (same tubes as SX-99) and the 6SG7 I pulled appeared weak. A new one from the box (surplus) tested well above the minimum "good number" level on my TV-7... if that gives you any insights.

Don't do it. It's a waste of money at any price.
You can build a more effective noise bridge yourself for cheap.

MFJ made two antenna analyzers. One was the "simple noise bridge" and
almost next to useless. The other one had the signal source and was rather
complex. It worked very well for what it is.

What model tester?

The inexpensive testers measure only emission and test for shorts. That's a
good test for power tubes and rectifiers, but not the most definitive test for
amplifier tubes. A tube in the "?" region of an emission tester may still be
good in many applications.

Better testers test for "gm", "transconductance" or "dynamic conductance" (all
mean the same thing).

In the SX-99, you want the best 6SG7 you have in the RF amplifier socket. The
IF amplifiers are less critical.
>
>Does the 6SG7 tube always test in the yellow range on other testers?

Not the ones I have.

Source record: 32923

I use the 'universal adapter #34012'....it goes in increments of
1.3/3/4/5/6/7.5/9/12

At the bottom of the adapter there is a polarity switch with a red light.
For whatever reason, the adapter stopped working and out of all the
adapters I have laying around, I don't have for 6volts at 300mA

I decided to just plug in a nine volt that is also carried on the plug for
that adapter...lol. Never thought I'd ever use it, but I plugged in the
nine volt and plugged it in the receiver and 'bada bing' .....I'm back to
monitoring. :-)

Has anyone ever used the nine volt if they had the same adapter as I, and
if so, how long did it last? I'll have to say, I can tell I'm listening
on a battery...it is just a notch quieter.

I'm going to have to get another adapter, in the groups opinion.....should
I get another universal ( I really like that one) or get one just for that
particular piece. It'd have to be INPUT:120V/ 60Hz/7W
OUTPUT: 6V CURRENT:300mA and at a 'negative tip.'

TIA :-)

Source record: 32924

Hello,

I have for sale the receiver unit from the German WWII FuG16 transceiver system. The complete unit has a transmitter unit, a receiver and a control unit. The frequency is 38,5 - 43,2 Mhz and the receiver uses the 9 pcs of the RV 12P2000 valve and 1 voltage stabilistor valve.

I receiver unit I have for sale is in very good condition (I would say nearly mint) and a picture is available. A copy of the complete handbook is inclusive.
This is not a cheap unit, but I am also interested in other German WWII receiving and transmitting equipment, so maybe we could change?

Regards,

Arnold Goks&#65533;yr

I also have a SX-99 and I'm sure I tested it's tubes (on a Superior
"Electronamic" type tester) and I don't even remember how well they tested.
They probably tested OK. Mostly I use my tube tester to cull out the
obvious duds. I've tested tubes which could hardly lift the meter needle
and they still work in circuit. These were in AF voltage amp stages which
had something like 220K plate resistors. I suppose the tester tested at a
much higher plate current, which the old tube couldn't handle. By the way,
I tried cooking the heaters at double voltage for a while. These tubes
eventually partially came back and the meter needle went up to around 40% or
so. "Dead" or "Weak", they worked fine and sounded good. Can't explain it,
but I'm not worried, either.

A small signal stage will oftentimes work just fine with a weak tube.
There's usually some compensating mechanism. Resistor fed screens and
cathodes will shift their bias points with weak tubes. A somewhat lower AVC
voltage will pick up the gain. Drifted resistors probably hurt old radio
performance at least as much as weak tubes. Not to mention crummy paper
caps. It wouldn't surprise me if the radio worked no better with new full
emission tubes as your weak ones. Tube testers can be handy, but it's in
circuit performance which has the last word.

Speaking of drifted resistors, your Heathkit tester might have a few.

Hi Kevin,

Well, they sure are cute- and make a nice pair w/ the 723 xmtr. But I agree- this is out of control. One went a few weeks ago for over $225 as I recall.

# 2717. RE: What is Best way to sell large collection

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-17 04:00:00 UTC
From: Jack Leishman <k8xx@gtii.com>
Message-ID: <v9s9k6ec7lqe54@corp.supernews.com>
Source record: 32940
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

I would like to know the best way of selling my radio collection of over 40 years collecting. First, it consists of 65 ham boatanchors, 225 BC band radios, 48 microphones, 27 keys, 26 novelty radios, 7 consoles and 73 transistor radios. Nearly 500 in total. The task seems almost impossible when relating to the packing and shipping aspect. I wonder if anyone has been in a similar situation and how it might best be handled. Most of the items are in very good condition and some are quite rare. Wanting to make the task as simple as possible, I am solliciting what may be the best avenues to follow. Most of the boatanchors are in the $100.00 range with the exception of: SX-23, SX-28A, SX-42, HQ-105TR, NC-183D, HQ-100 AC, SX-100 Mk II, Viking II and SX-71. The BC radios are most in the $50.00 range with the exception of Fada 711, Rare Philco Transistone, R-4 Radac, A-600 Zenith Leather transoceanic, Sparton 6AM26X and several push button bakelite models. Most of the radios are bakelite or plastic with only 10% being wood. The mics are in the $60.00 range except for three RCA 74B junior velocity types. The novelty radios are all in the $30.00 range. The transistor radios are also all in the $30 range excdept for a Philco T-9 Transworld, Weltron 2001 space ball, Watterson 604, Emerson 888, several Zenith Royal 500s and a few more. The bulk of the collection, as you can see, is in the price range where you can't afford to spend too much time packing and shipping. I am now in the process of compiling a complete list of items with prices, but the collector program I am using seems difficult to work with. If I were to sell complete collections, what would be a fair discount from the total price? Most would be sold as is. Fewer than 10% of the BC radios have any cracks or hairlines. I tried to give as much info as I currently have on the collections. Fair prices are being determined from many sources. Thanks for any help in solving this situation! Jack K8xx PS: A few pictures of the items are on my 3 year old home page.

Hey all,
I am simply looking to find a pair of philbrick or similar tube opamp modules. I am an undergraduate engineering student and I was hoping to toy around with these to see what they can do. These modules semed to be quite popular a long time ago. I could also use a +/- 300 volt regulated supply, as I really have no idea how to make a decent regulated -300V source.

Thanks,

Mike

Unless you run find very wealthy collector who doesn't own many radios and wants a huge "instant" collection, you're not going to get anywhere near what they're worth selling the collection as a whole.

If you're trying to get a "fair" price, you're going to have to sell the radios separately, or in logically related groupings.

Hmmmm. Traverse City, eh? Not that far away.....

One of the things you didn't mention in your post was the time frame. How quickly do you want to move the stuff? One thought is to hold an auction, along the lines of those listed in 'Antique Radio Classified.' But in order to reach as many interested people as possible, you would have to advertise many months in advance.

I can't believe how sloppy I am. The only "excuse" is that I'm in a rush.

The first sentence should read

"Unless you find a very wealthy collector..." or

"Unless you run into a very wealthy collector..."

Sheesh.

I probably have some HP ones in the closet somewhere. Expect a lot of
drift and a very low Ft in the tens of Hz range.

You can build the supply just like you build a +/-15V supply, just with
a higher voltage transformer and with pass regulators built with a zener
and a TIP50 transistor rather than a three-terminal 7815.

No, but I think it's possible to get smaller crystals with an adaptor which will work in most designs. JAN can definitely do it. It really depends on how much current you have going through the crystal; on a one-tube 100W transmitter the smaller crystals will definitely not work for long. But on most designs they're fine.

I _wish_.

I learned a long time ago that shipping by UPS is bad for equipment,
and that UPS appears to think nothing of dropping a box a foot or
more multiple times in-transit.

Now I ship by Fed-Ex, and request shipping by Fed-Ex when I'm buying,
and stuff arrives in beautiful shape.

What annoys me is the number of sellers on eBay who will not
ship any other way than UPS. Not only is using UPS more likely
than any other shipping method to result in damaged goods, they
are a PITA to deal with here locally, and they only ship 2nd Day
Air to Alaska, hence it is outragously expensive.

Yet there are many sellers who simply will not take even a small
item down to the post office and send it Priority Mail!

From my perspective, there is no deal if the only shipping is
via UPS.

Prior to retirement, many people live where we can find
employment. Once you've retired, that is no longer part of the
equation. It becomes a matter of where, of all the places you
can afford, would you *most* want to live. Sometimes the two do
happen to be in the same place, but not everyone is that lucky.

Ask around for those who are looking for the items you are selling. I
suggest asking those who have less to give them a chance of getting
something nice they want instead of those who already have one or more

of the same only to say how much they have. Someone who has a little can afford something as well as someone who has a lot and will appreciate it more. I have been passed by because I had less than someone else who has too much and they had first pick, the person knew I wanted what they had for sale, while I may have had the option of getting what was left, if any, items. Letting someone with less get first pick will help you later, they remember your act of kindness.

If you can go to a hamfest, that is an excellent way of selling. If you want to use Ebay, that can work. Remember that some will gladly pay the price then balk at the shipping, e.g. one coast to the other, thinking it will be a few dollars, a seller's personal experience speaking. Local sales will be easier for you since there is no packing or hauling on your end. There are some who will drive some distance for what they want. It sounds like you have nice selection of items you want to sell.

Mark

I believe that there is someone currently on the Ampex mailing list
who says he is retiring and is looking for old electronics gear to
work on in his retirement. Perhaps these two people could get together?

<snip>

I don't know how big Traverse City is; but do you have any good antique consignment stores in the vicinity? You could arrange to supply them with a good steady selection (not all of them at once...that would devalue the market) in exchange for a percentage. I would have an attorney draw up an ironclad agreement with tight accounting for all sales.

I think that then I would drum up some p.r.; either ads in the papers (classified?), tv or radio(!)...maybe even try getting some actual press coverage. That's a *lot* of radios...at least by normal standards (as opposed to the standards here in the ng <g>). Someone with a good approach should be able to turn the situation into a good human interest feature.

The above would negate shipping/packing individual radios; and your actual participation would be as great or as minimal as you desire. For instance, you could offer to set up displays within the store, or you could leave that to the owner. You could design/buy your own advertising, or you could make it part of the deal.

If your town is too small, you might have to look to the larger cities in the vicinity.

Here's an idea for you Jack. A few years ago members of an antique radio club I was a member of were invited to be the sole participants in an auction a deceased member's (a 50+ year collector if I recall correctly) family had to dispose of his radios/speakers, etc. etc. The auction was advertised only to the club members and some members helped move the items out of the house into a yard where the auction took place. There was a fee charged other members who didn't help move the items for sale.

Because the buyers were knowledgeable, items which were worth $$ brought $$. There were so many items (as I recall 90 horn speakers alone), it took 2 days to completely dispose of them. But, the point is, the auction allowed for interested and knowledgeable buyers, and the sellers didn't have to transport ANYTHING, and saved a lot of time over "Ebaying it" which I think allowed bidders/buyers to pay more because they knew they didn't have to pay shipping. A club member served as the auctioneer. The club gained a few members because word spread that only members were going to be allowed into the auction.

My guess is there's a club or two near you that would be interested in doing the same thing. Good luck.

Another good idea. Beware that in some states (Tennessee is one) that
auctioneers must be licensed, although I have no idea why).

I would like to know the best way of selling my radio collection of over 40
>years collecting.

Jack,

The Michigan Antique Radio Club's Extravaganza is coming up in July 10-13th.
It is held in Lansing and is probably among the top ten largest radio shows
of the year. It may be an opportunity to sell a large portion of your
collection.

If your interested drop an email to Mark Oppat moppat@flash.net and he can
give you any info you may need.

Regards .. Larry Fowkes

Jack,

I did the same thing a few years back, and was AMAZED at the rude offers I got! I had about $10,000 worth of ham gear, and one guy audaciously offerred $500, and told me that's all they're really worth.

I've since sold them off the hard way (all are gone and I moved to a sunny place condo with a view!) for an end price of just under $15,000. Just took LOTS of effort, trips to UPS, Fed Ex, the post office, and U-Haul (to buy boxes).

Unless you find that Bill Gates has started collecting boatanchors, you'll never get the full tilt on the lot.

Ex ham in Arizona

# 2745. hallicrafters sx-71 help needed

To All,
I got the service bulletin and operating instructions for my Hallicrafters sx-71 from the Bama site (thank heavens) and started to do the alignment (my first time ever!!!) and for the life of me I cant find the called for adjustment points. The procedure calls for adjustment of U,W,X,Y,Z and 1,2,3,4,5. I looked at every page of that document (19 pages) and the schematic and still cant find these adjustment points.... HELP!!! Note that someone in the past was nice and wrote the A through P points on the bottom of the chassis... but I cant find these..... So if someone know where these adjustments are, or of a document that shows them or has an sx-71 with these written in.. Please tell me what and where they are...

Thanks
Bob

There have been lots of good comments and suggestions, but the concensus seems to be that Ebay might get the best price at the risk of taking the most time and effort (makes sense to me). Why not combine a couple of the ideas? For instance, why not hire a local radio club member or two to handle the ebay sale for you, and pay them a comission? It could be a cash comission, or could be as simple as leaving the stuff that they'd like till the end of the lot, so that they can take something instead of cash as payment? You might even find that they would be able to sell some of it at an agreeable price without having to put it all up on Ebay. If the club members handled it as a club instead of as individuals, then the benefit would be to the club as a whole, which can't be a bad thing either.

just my $.02

cheers

Because of the danger of the house entering phantom bids... I heard
about the head of a department at a major auction house being fired
when he told someone that they were bidding against a representative of
a major film director in a private showing of a piece. The person
happened to know the director's bidding agent, and found out that the
director wasn't interested in the piece. The auction house employee had
been entering phantom bids just to get this guy to up his bid.

When my dad passed away, we did this. No one in the family had the experience to describe the radios and answer the questions. The fella that handled it for us did a great job, and more than earned his commission.

Let this be a warning to everyone- I'd suggest trying to avoid accumulating large numbers of $50- radios or phonos. It does make for more difficult liquidation when the time comes. It's hard, but I just have add to draw arbitrary lines and sell off things that no longer make the cut as far as brand, performance, tube count, and ultimate value. I've concluded I'm taking a middle path between the move-um-out Wieck Diet System, and those who have thousands of crusty, dusty radios entirely filling their former homes. I don't mind accumulating a backlog of restorations, but not 100 years of leisure time's worth.

John H.

PS- I vote for a club sponsored estate sale for this case.

I received an NC-57 with the tuning flywheel loose and bouncing around inside the case. No obvious damage, but it can't have been good, So when shipping boatanchors, I now think it's a good idea to fill the >inside< of the case with peanuts too, so if something comes loose it can't go far.

The smartest thing is to do this, only I'd simply pull out the 10% of the items that are easily shipable and/or valuable to sell on eBay, and haul the rest to swaps and sell at fire sale prices. I regularly sell 3/4 of what I bring if it's aggressively priced.

John H.

Not a good idea. I've spent too much time picking tiny pieces of foam from "hard-to-get" places. If you do this, at least pack the peanuts in a bag.

# 2760. FS: Alpha 78 No-Tune HF Amp

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-18 03:31:28 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <kkKna.28325$ey1.2562357@newsread1.prod.itd.earthlink.net>
Source record: 32883
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Self-contained desktop HF linear amplifier capable of continuous operation at input powers in excess of 2 KW PEP/SSB and 1 KW continuous carrier with no time limit.

Manually tunable from 1.8 to 29.7 MHz.

Four bandswitch positions provide NO-TUNE-UP operation at full legal power on the 80-15 meter bands.

High-speed QSK break-in operation.

Export model has a tenth position that provides no-tune-up 10 meter operation. Operation may be broadly peaked for optimum efficiency across 28-29.7 MHz using the front panel load control.

A sub-band selector switch selects optimum no-tune-up arrangement for either CW or Phone, 80-10 meters.

Three Eimac 8874 ceramic, grounded-grid triodes, air-cooled. Full output power. Wired for 220V.

This low-time unit is extremely clean both inside and out. The suede front panel is in the best condition I've ever seen. No wear around the dials and switches as is usually found on this model.

One-owner unit. Serial #8637. Original factory manual/schematic included.

This unit will be professionally foam packed in two cartons. Transformer shipped separately. 70 pounds shipping weight.

Asking $1750.00. Buyer pays all actual packaging/shipping/tracking/insurance costs.

Excellent Valiant for sale. This unit has been used on 75 and 40m for several years. K2AW diode blocks replace 866 rectifiers, new filter caps in ALL PS, new finals, new modulator tubes, rebuilt VFO, very stable, no chirp, Re-built AF Section, SUPER AUDIO! New driver trany, PTT, new output caps, Cabnet not original colour, but nice.
PICK UP in MICHIGAN or meet within 150mi.
This is a great transmitter, RF OUTPUT IS 150 watts AM, 200 + on cw.
$550 OBO

# 2768. FS: Wehrmacht FuG16 receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-18 15:06:45 UTC
From: arnoldg@c2i.net
Message-ID: <3ea014b9.255078@news1.c2i.net>
Source record: 32891

Hello,

I have for sale the receiver unit from the German WWII FuG16 transceiver system. The complete unit has a transmitter unit, a receiver and a control unit. The frequency is 38,5 - 43,2 Mhz and the receiver uses 9 pcs of the RV 12P2000 valve and 1 voltage stabilistor valve. It is very well and compact built, and truly a beautiful item.

I receiver unit I have for sale is in very good condition (I would say nearly mint) and a picture is available. A copy of the complete handbook is inclusive.
This is not a cheap unit, but I am also interested in other German WWII receiving and transmitting equipment, so maybe we could swap?

Regards,

Arnold Goksyr

## 2769. What is Collins part 70E-8H

Newsgroup: rec.radio.amateur.boatanchors

Source record: 32799

Hi all,
I am clearing out of the shack all of my Atlas equipment.
(Well, in all fairness, I will probably keep a few of them, hi hi.)
In any event, I have many to chose from, all working but without mics.
I have 180's, 210's, 210x's, 215's and 215x's. Sorry no 350's or
others...never got into any others than the ones listed...
I will not give them away, but would entertain a fare offer for each.
Anyone intereted in an Atlas, and re-live the 70's??
Let me know what model you need.
Each will be sold as is, but I will check out on my Bird 43 / 100 watt slug
prior to price given.
Also, each will come with a CD of the complete manual.!
I am also interested in finding an F6 Kenwood but... it needs to be mint!

# 2777. Drake TR-4 Noise Blanker Info wanted

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-18 21:07:37 UTC
From: Norm VE3CZI <ve3czi@arrl.net>
Message-ID: <2VZna.8071$h%2.704698@read1.cgocable.net>
Source record: 32800
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I have a Drake TR-4 Xcvr. It has a Noise Blanker switch on the front, but there are no wires going from switch to anything...obviously the NB was removed.
There are 2 NB listed for the TR-4. A [34-PNB] & A
[9-NB]
The 34-PNB looks like it has a plug assy that would plug into a socket on the TR-4, but my unit has no such socket.
Does that mean my unit should have the 9-NB unit?
Does anyone know how to tell which NB should go with which model of TR-4?
Does anyone have one of these units for Sale, or a suitable equivalent?
Thank You for any assistance
Norm VE3CZI

Someone up on Drake guts will answer for sure, but I think the 34PNB was for the receiver (R4C). Perhaps the noise blander for your TR4 was an option...like it was in 2C and R4c etc.

Hi,

What luck have you had with Chinese 572B tubes?

Any with Penta Labs?

Generic no-name Chinese 572B?

Other Chinese 572B?

Inquiring tube purchaser needs to know. My Clip L needs 4 tubes!

Thanks,.

Bob

# 2780. Swan 700cx - Some Questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-19 00:55:01 UTC
From: Dave <dave@somewhere.net>
Message-ID: <6k61avg77kptng6605cj68bq118auo6a2j@4ax.com>
Source record: 32803

Howdy,

I just bought a really nice Swan 700cx from a friend of mine who is leaving the country. It came with the 117xc power supply and a Model 508 VFO. It also has the original Shure mike and a Silver Eagle.

I've never owned a tube transceiver before so I'm going to have to learn how to use it properly. I have a couple of questions that maybe someone could help me with.

1. The 508 VFO plugs into the accessory socket on the back of the radio. To use the radio WITHOUT the VFO connected apparently requires a jumper plug to plug into the accessory socket. This apparently has been lost and I can't find a diagram for it in the manual. Does anyone know what pins need to be jumped to allow use of the radio without the outboard VFO?

2. I understand that the 8950 tubes are hard to come by. Maybe I should buy a spare pair while I can. Where can I get a matched pair?

3. The radio seems to operate perfectly except that there is an intermittent hum (quite loud) (60 cycle?) through the speaker. It comes and goes by itself every few minutes but sometimes if I tap the radio It will go away for awhile. Does this sound like bad caps or what? Could it be in the power supply?

I've got to tell you that I am really surprised how good this radio sounds on receive. It actually seems to have better audio than the Yaesu FT-990 that is my other radio. I would like to get the little problems ironed out with it and use it.

Any help would sure be appreciated.

Thanks,

Dave Alden WK8F dalden@comcast.net

>....Dave

The 2-NB noise blanker is for the 2C receivers.

The 34PNB noise blanker is for the TR3 and TR4 transceivers.

The 4-NB noise blanker is for the R4C series receivers.

The 7-NB noise blanker is for the TR7 transceiver.

The 9-NB noise blanker is for the TR6 transceiver.

Absolutely! Tell'm up front the buyer is responsible for the shipping and packaging costs. You will have to wrap and double-box the sets, but you'll get the most money on eBay. You can also list the items with prices on the rec.radio.amateur.swap newsgroup if you have a selling price in mind.

Take a look at the RF Parts website www.rfparts.com , they have some
notes regarding 572B's, and they sell a couple of different versions.

As regards personal experience ... don't have any. I've never used a
Chinese tube, and never will.

From: Roger Leone <arleone.takethisout.@inreach.com>
Message-ID: <nbfoa.122$972.102@news.inreach.com>
Source record: 32812

Dave:

Swan's had a reputation for sounding good, both on receive and transmit. I don't have a manual for the 700 and couldn't find one on BAMA.

My Swan-350 manual may help. If the accessory socket is a 9 pin (looks like an octal with an extra pin) you probably need to jump pin 1 to pin 8 and pin 3 to 4. That will allow the internal VFO to function instead of the external. You can confirm these pin numbers by taking off the bottom cover and looking at the inside of the accessory socket. You should see two small coaxial cables going to pins 1 and 8. You should see pin 3 wired to a zener diode and pin 4 is wired to the internal VFO circuit board.

If the AC hum is intermittant and goes away with tapping on the case, I would suspect an oxidized ground terminal near one of the tube sockets.

Good luck,

Roger K6XQ

## 2790. Any Info on RBW-3?

You don't have to use 8950 tubes, they are expensive!
Try 6KD6 or 6LB6, they have the same pinouts as 8950, the only
difference is the heater voltage, 6.3V vs. 12.6V for 8950. Just make
series connection for the heater terminal on the tube socket, it will
work as good as 8950. And 6KD6 and 6LB6 are cheaper and easy to find.

The Michigan Antique Radio Club is one of the largest in the nation, and hosts its annual "Extravaganza" in Lansing each July (10-12 this year). On Saturday, a large auction of radios is held, with over 200 items usually. Each person registering for the auction gets 5 items auctioned for sure. You could bring you most choice items. You could also get a few sales spaces in the flea market for about $75 total, and sell items there.

you probably know Ernie Nagy, an Elk Rapids resident, who is a MARC board member.

INFO on EXTRAVAGANZA SPACES, email:

donsradio@Comcast.net

# 2806. Better MIC for Radio Shack HTX-10?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-20 13:55:37 UTC
From: ezela57383@aol.com
Message-ID: <20030420095537.18987.00000318@mb-m18.aol.com>
Source record: 32829

The Radio Shack HTX-10 (10 meter mobile rig) has muddy audio, particularly on AM (can't expect much for $69 !), which has been attributed to a cheap, poor quality mic.

Does anyone know of a good after-market mic (with the up/down tuning feature) available for these rigs? If not, I wonder if someone has found a better mic element?

Thanks!

Emil
KA8GEF

Dave,

I had a 500c years ago (now in storage). I had the intermittent hum
problem too. Mine came and went when I wiggled the power supply
cable/plug at the rig. Was due to some corrosion on the connector
pins. Not sure if that's your problem, but it's worth a try.

# 2809. TRADE: Swan 350 w/117XC supply for SB102 w/HW23 supply

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-20 15:40:38 UTC
From: Chuck Harris <cfharris@erols.com>
Message-ID: <b7uf8b$81k$1@bob.news.rcn.net>
Source record: 32832

Hi,

I have a nice condition good working Swan 350 with new finals.
that I would like to trade for a Heath SB102 in similar shape.

The Swan is available with 117XC speaker/powersupply, hand held
microphone, and manual. It has been tuned up as per the manual,
and works very well.

It comes w/manual, if the SB102 comes w/ manual.
It comes w/power supply, if the SB102 comes w/powersupply.

I will accept cash offers that match the average price of a
SB102/HW23 on ebay.

I'd look for a heater-to-cathode short in one of the tubes. Does
the hum vary with the volume control? If not, then the audio output
tube is suspect. If it does, look earlier in the chain. Enjoy your
radio! These are great rigs!

That's not an issue for in-person auctions though, or it shouldn't be, as
everyone can see when anyone is bidding. You can also ask a lawyer if only
allowing club members perchacne makes it a 'private gathering' rather than
a public auction which would require a licensed auctioneer.

## 2817. R390A Mailing List or Info?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-20 22:07:21 UTC
From: Bob Lombardi <blombardi@cfl42.rr.com>
Message-ID: <3EA31A63.5080005@cfl42.rr.com>
Source record: 32840

I was just going through aligning my R-390A, and came across a couple of things that puzzle me. I started looking for a discussion group on Yahoo and it seems the R390 list hasn't been posted to in a couple of years.

Is there a current discussion group on these boatanchor receivers? Is there a place where archives of discussions might be found?

Lacking that, I find that sensitivity drops on a couple of bands by as much as 10 dB. I'm assuming it's the crystal for that band being low in activity and the conversion being lossier. Anything else to look for?

Thanks,
Bob
W4ATM

for direct email, there are no numbers in my address, and certainly not the answer to life the universe and everything else.

In my neck of the woods there are several local businesses that
specialize in
running estate sales. One is called 'Bernice's Sellout'. Usually they work
with an entire house full of stuff that is to be sold off. They place
ads in the
local papers and run a huge 'garage sale' at your house. If you have a
large
enough collection of radios to be sold off, a few rooms plus the garage that
can be dedicated for the sale (close off the rest of the house!) this
might be
the way to go. If the collection is valuable enough, they might
advertise in
a multi-state area in advance to atract more buyers. I don't know what
kind of
commission they would charge you, but it might be worth it.
I tried to go to one of these sellouts a few years ago that had
advertised ham
radio equipment as part of the estate. I got there early, but not early
enough.
Besides having to park several blocks away(!), someone else picked up an
entire
S line in good shape for a low enough price that I'm sure it was on ebay
the next
week. In this case the owner didn't know what is was worth and neither did
Bernice. If you go this route, educate the agents!

Hi Andre

This is an understandable error. This group is for "boatanchors", where
the "boatanchors" are heavy old radio receivers, usually for shortwave
and/or for amateur radio use, and usually tube type.

cheers

Genuine rubber feet for bottom of BIRD wattmeters! These are the REAL THING direct from BIRD Electronics. These are also the feet used on the back cover of new BIRD meters. To use these on the back cover of older meters, just drill out the rivets of your old rear cover bumpers and push these in the holes just like the bottom. Use same size hole as the bottom of meter. 4 feet (for bottom of wattmeters, like the 43, 4431, 4304A, 4308, 4410, 4410A, 4314B, APM-16 etc.)
Plenty available.

Four feet for $5 postpaid in the USA

PayPal RFpower@radiodan.com
Check/cash OK via callbook address

See all my BIRD wattmeters, elements, slugs, dummy loads, etc at www.radiodan.com/bird

73, Dan Magro W7RF

<snip>

Ya' know, I've seen several excellent strategies to the OP, but nobody has responded to my suggestion of local antique consignment stores (sniff).

I'm not whining, but it still seems to me that this 'could' be a very good way to unload this collection. It could be done with as little or as much labor on the OP's part as he desired. There would be no packing beyond that necessary to get the items to the location...hell, you could toss a few into the back seat a couple times a month and tote 'em down...no shipping

The only problem I can see would be locating a participating dealer. Perhaps there are no such places in the vicinity. There are dozens here in NashVegas.

Most of the the radios I've seen in such places go for *way* more than they're worth (at least they are priced higher..couldn't say what they actually sold for).

Bad idea for some reason?

jak

Source record: 32761

A modulation transformer typically finds itself in series
with the anode power of the RF final stage of a transmitter.
This means that it has a heavy DC current passing thru it
at all times. Were it not for the gap in the core, this
heavy DC current would saturate the transformer, and it would
cease to function as an iron core transformer, and function
more as an air core transformer.

Because of the gap, the transformer needs a lot more copper and
iron than would a normal P-P transformer on the output of
a 120W tube stereo.

Also, this transformer was most probably meant for a system that
was capable of running 120W of modulation continuously 24 hours a day.

Are you SURE a mic will help?

I have the HTX-10 and have had good audio reports on 29 MHz AM.

It could be that you are just running the mic gain a bit too hot.

## 2840. Re: What is Best way to sell large collection

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-21 13:29:23 UTC

I'd list them on the Radio Attic, several at a time. Radios move there.

I've used consignment shops in the past. Usually my sets are played
for 12 hours a day (for the benefit of the proprietors), and seldom
sell for anywhere's near the asking price. I had one RCA 5T (fully
restored)
that wouldn't sell for $100, even though it sat playing in the antique
store
for 15 months.

Pete

p.s. It's back on my shelves!

# 2851. Swan 700cx - Thanks for the help!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-22 01:15:43 UTC
From: Dave <dave@somewhere.net>
Message-ID: <ll49av8p0p68gsguo0rtbaps16cv5q0sb2@4ax.com>
Source record: 32774

Thanks for the great response to my questions about the 700cx I just bought.

I was able to make a couple of jumpers to short out pins 1&8 and 3&4 on the accessory socket and can now operate without the outboard VFO.

As far as the hum problem: I took out all of the tubes and cleaned the sockets and pins. I tightened up all screws and nuts on the chassis. I cleaned the contacts on the power supply cord. And most importantly, I ran a 3/8" braided ground wire from the power supply chassis to the radio. ZERO hum now.

I also cleaned all the contacts on the rotary switch for the bands. Boy is that a scary switch. I'd hate to think of replacing that thing! Has anyone heard of some kind of contact plating compound that is suppossed to plate the contacts with silver?

I was wondering if it is OK to switch bands while the radio is powered up and in receive mode or would it be better for the life of the switch to power down before switching bands?

I think that I'm going to replace the speaker in the power supply with a better quality one. The old one looks pretty dried out. It looks like about a 4" speaker and according to the manual it is probably 4 ohm. The radio has so much audio output that I just have to crack the RF Gain knob a hair before the volume is too loud.

I still can't believe how good this radio sounds. It takes a while to get used to tuning a SSB station in because the knob is so sensitive (compared to my Yaesu). But, the clarity of the signal puts my Yaesu to shame. The Yaesu sounds absolutely muddy compared to the Swan.

I haven't gone on the air with it yet but now that I have it cleaned up I'm going to practice tuning it up and have a go at it.

Thanks,

Dave WK8F dalden@comcast.net

This classic Heathkit HF amp is in excellent working condition. Cosmetically
8/10.
Some minor chips around the edge of the front panel caused from
removing the outer cabinet.
This amp has:
Full output from two 3-500 tubes
Harbach soft-key mod for use with modern solid-state transceivers
Harbach meter board replacement with meter protection and heavy duty diodes
AG6K (Rich Measures) mods
New feet
Asking $525.00 plus professional boxing (professional foam packing to assure
it wont arrive broken) and shipping/insurance costs.

Here is a bunch of stuff for sale. Prices do not include shipping unless

specified.

W.W.II BC-464-D Receiver and Selector. .....$50 plus shipping

This is a 67-74 MHz, AM, 5 channel receiver, used to control pilotages
aircraft.
Used with BC-463A transmitter. This unit looks to be new and unused. It
is missing one tube.
It is untested. This unit has a date of June 1945

http://members.cox.net/radiostuff9/bc4644.jpg

Signal Corps BC-1335 Receiver and Transmitter.....$85 plus shipping
Signal Corps US Army BC-1335 Receiver and Transmitter made by Delco.
This is a 17 tube vehicular
radio that covers 27-38.9 MHz. It is FM, 2 channel, with a crystal
controlled receiver and transmitter with provision for an antenna to be
mounted to the case. You can use this to work 10 meter FM. The unit is
complete except for one tube and appears to be original and unmodified.
It still has the extra fuses and Allen wrench!

ere is a bunch of stuff for sale. Prices do not include shipping unless

specified.

Click on the links for pictures.

Heathkit HW-100 Transceiver and HP-23A PS .....$210 plus shipping

A real clean Heathkit HW-100 transceiver with CW filter and HP-23-A
power supply, original manuals
and connecting cable. I have checked out the transceiver and it works
well on transmit and receive. All tubes have been
checked and several weak ones were replaced. All three rubber drive
belts have also been replaced with new belts.

US Navy AN/URM-25G Signal Generator.....$135 plus Shipping

This well built unit covers 10 kHz to 50 MHz in 8 bands. The unit has
been tested and works great. With a frequency range of 10kHz to 50mHz,
400Hz and 1,000Hz AM modulation, and an attenuator calibrated 1
microvolt to 1 volt RMS, this generator makes easy work aligning Collins

R-390, R-388, R-392, Hammarlund SP-600, National RAO, HRO, as well as
WWII military BC-348, BC-312/342 and others. The low frequency range
covers IF's in the 50kHz range for receivers like the Hallicrafters
SX-88, Drake 2B, etc. . Includes a copy of the manual. It does not have
any of the accessories that go iinside the cover. This unit is heavy.

Eimac 304TL Transmitting Tube - $65
http://members.cox.net/radiostuff9/304tl2.jpg

Eimac 304TL Transmitting Tube - $65
http://members.cox.net/radiostuff9/304tl.jpg

These all came from an estate. All appear to be in excellent condition. I am only able to test filament continuity and all test good. The brown haze is a reflection off of the cloth I used as a backdrop for photographs.

Welz SP-122 (Yaesu YS-60) Power Meter.....$80
Welz SP-122 in-line wattmeter and SWR bridge. This is the same unit as the Yaesu YS-60 power meter.
I believe that these were built for Yaesu by Welz or Yaesu built them for Welz. This meter will measure average and peak transmitter power output from 1.6 to 60 MHz over three power ranges - 0-20, 0-200 and 0-2000 watts. This unit works well and is in excellent condition. Includes a copy of the instruction sheet

http://members.cox.net/radiostuff9/welzmeter.jpg

As I recall it has a four-pin connector like the 664 and the like so you
can get high or low Z. Dunno the exact loading it wants but EV will still
have data sheets.

Is this the one by Doug DeMaw and Wes Hayward, which came out in
1977, sort of a greyish cover? It was called "Solid State Design
for the Radio Amateur".

The ARRL did keep it in print up to at least a few years ago.
Unless saving money is the key, you might see if they still
have any copies.

Michael VE2BVW

Ballantine 3056A AC Voltmeter - near new $155.00

Communications Technology Systems Davar D8020C Cable Analysis System $1,085.00
W/ shipping case, oper. manual. Not tested. Near new condition

Cushman CE-24A Frequency Selective Meter $240.00
Works, but seriously out of frequency calibration

Demornay Bonardi DBF-X-187 Variable Attenuator 0-50db $290.00

ESI 240C Kelvin Ratio Bridge $655.00

Fluke 760A Meter Calibrator $589.00
Fluke 893A AC/DC Differential Voltmeter $190.00
Fluke 2190A w/ Y2001 Digital Thermometer & Interface $279.00
No probes. Fair condition: minor plastic chips

Fluke 6039A w/ Opts. 2,4,9 Frequency Synthesizer $549.00
Fluke 8505A Digital Multimeter $240.00
DC Volts only: no other option boards available

General Electric - GE Type P3 Frequency Meter $195.00
120V 400Hz - Range 350 to 450Hz Works - not calibrated

General Radio - Genrad 1390B Random Noise Generator $199.00

Holtzer - Cabot AN/PSM-2-A Ohmeter 1000 Megohms 500 V - no leads incl. $99.00

Kodak Colorado Aerial Film Printer $5,500.00
w/ MacBeth Comparator. 64 Hrs use. Not tested crating $250

Kikusui PAB18-3A Power Supply 18V 3A $149.00
Kikusui PAB32-2A Power Supply 32V 2A $220.00

Nicolet 660B FFT Analyzer $425.00
Channel A works. Channel B does not work

Panasonic AG-6200 VHS Editor $155.00
Panasonic NV-8200 VHS duplicator ea $125.00
Good condition. W/ carrying case - 2 avail.
Panasonic NV-8200 VHS duplicator $75.00
Poor condition. Needs repairs

Philips PM 6670 Timer / Counter 120MHz $299.00
Philips PM 6676 Universal Counter 1.5GHz $389.00
Both above models in very good condition

PRD Electronics 559-B Frequency Meter $147.00

Wavetek 271 Function Generator $179.00
Fair condition. Works, but keypad hard to operate

Weinschel 2692 RF Attenuator 30db $159.00
SMA type connecters

Weston Model 370 Ammeter 2 Amps - collectible - vg cond. $119.00
Weston Millivoltmeter 500 mV $99.00

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4673&item=3020415216

Like new tuning dials from HQ-110 receiver. Both the
bandspread as well as bandset. No marks, burns, or
scrapes. Set screws intact. Excellent condition.

# 2875. FA: National Radio R-100 RF Choke on Ebay - NOS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-23 01:18:49 UTC

Excellent - NOS National R-100 choke, still sealed.
5.0 mH - great for most any homebrew transmitter.

# 2876. FA: 80 Meter FT-243 CW crystal on Ebay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-23 01:20:46 UTC

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4675&item=3020418574

3.640 MHz - tested in one-tube rig and has full
output and great CW note. Good frequency for
CW on homebrew and vintage rigs. CR-8/U case,
which is essentially the same thing as FT-243

HAMMARLUND, HALLICRAFTERS, AND OTHER TUBE TYPE RECEIVER OWNERS:
It is likely that your receiver has one or more 6BE6/5770 tubes. I have a number of brand new, in the factory box, 5750 electron tubes. The 5750 is the JAN military low noise version of the 6BE6W and is interchangeable with 6BE6 and 6BE6W tubes.

Price: $2.25 each, plus shipping. Save on shipping by ordering as many as you need at one time.

That book has been replaced by:

Experimental Methods in RF Design

But it isn't cheap!

See:

http://www.arrl.org/catalog/index.php3?category=Technical%2C+Electronics%2C+and+Communications+Reference

Sorry but I won't sell my copy of the old Solid State design book.

Regards,

Dave

If the original book had the 509 pages of the new one and cost the same amount per page, it would sell for $42.25 in today's dollars. But you get a CD with the new book for the extra $7.70.

Hi All,
I have a 10mts dedicated radio that I brought back from the states.
It is full multimode SSB FM AM Etc.
It is still in it's box. My wife bought it for me and thought she was doing good but I am a G6 so 10 mts is out of the question. I am not licensed to operate it. Full radio ham holders will know what I am on about. I will sell at cost to me. anyone interested reply to mike@mikadene.co.uk

Source record: 32666

Hi...
I acquired a BC-348 reciever that I managed to ressurect. It has been "hacked" pretty good but after some caps and an alighnment she is sounding good.
I looked at the manual and my question is..
Is there a way to "mute" the receiver.?
I would like to use it maybe with an old Globe Scout if I could.
I saw in the manual there was a board with connections for a transmitter but can't find it on the rig.
Also...it does not have a case. Is there a source where I can look for a case for it?
It needs a painting and the lettering redone. Anyone out there have any suggestions for relettering?
I know alot of questions but it sounds very good and would like to use it.
Thanks in advance..

Allen (Marty) Martin wrote:
> Can anybody tell me the impedance of this mike?
>
> Thanks
> Marty
>
>
Mic impedance is selected by the wiring at the cable connector
at the base of the mic. The connector is a type MC4M.
Pin 1 is shield.
Pin 2 is High Z
pins 3 and 4 are 150 ohms (balanced output).

The mic cable supplied has 2 wires (white and black) plus shield.
For Hi Z use, black is connected to pin 4, white to pin 2,
shield to pin 1. No connection to pin 3.

For low Z use, black is connected to pin 4, white to pin 3,
shield to pin 1. No connection to pin 2.

Can't speak for sure since I don't know how it was "hacked,"
but the original design muted the radio by switching B+
through a relay that was connected between pins 2 and 6 on
the rear connector.

Heathkit Grid Dip Meter with original box and original manual.....$70
plus shipping

This a later model GD-1B. It has a different and newer looking meter
than most GD-1Bs and the publish date in the manual is 1960. The unit is

in very good condition. It has been tested and works fine. Includes a
full set of coils in the original coil box and the original the manual.

US Navy AN/URM-25G Signal Generator.....$135 plus Shipping

This well built unit covers 10 kHz to 50 MHz in 8 bands. The unit has
been tested and works great. With a frequency range of 10kHz to 50mHz,
400Hz and 1,000Hz AM modulation, and an attenuator calibrated 1
microvolt to 1 volt RMS, this generator makes easy work aligning Collins

R-390, R-388, R-392, Hammarlund SP-600, National RAO, HRO, as well as
WWII military BC-348, BC-312/342 and others. The low frequency range
covers IF's in the 50kHz range for receivers like the Hallicrafters
SX-88, Drake 2B, etc. . Includes a copy of the manual. It does not have
any of the accessories that go iinside the cover. This unit is heavy.

Eimac 450TH/VT-108 Transmitting Tube - $200
http://members.cox.net/radiostuff9/450th2.jpg

These all came from an estate. All appear to be in excellent condition. I am only able to test filament continuity and all test good. The brown haze is a reflection off of the cloth I used as a backdrop for photographs.

Welz SP-122 (Yaesu YS-60) Power Meter.....$75
Welz SP-122 in-line wattmeter and SWR bridge. This is the same unit as the Yaesu YS-60 power meter.
I believe that these were built for Yaesu by Welz or Yaesu built them for Welz. This meter will measure average and peak transmitter power output from 1.6 to 60 MHz over three power ranges - 0-20, 0-200 and 0-2000 watts. This unit works well and is in excellent condition. Includes a copy of the instruction sheet

http://members.cox.net/radiostuff9/welzmeter.jpg
http://members.cox.net/radiostuff9/welzmeter2.jpg

I will ship overseas.

You can check my user ID "n7rk" on Eb*y for a reference as to dealing with me.

Thanks for looking and 73,

Dave N7RK

Source record: 32677

It uses a hi impedance. I use a amplified base and the Astatic 10-DA...the 'bullet shapped head'. The base is from a D-104.

I would think a ceramic D-104 with pre-amp would do fine. The preamp helps with a wider response.

I get good reports on AM with this arrangement.

Source record: 32686

Hi

I have combined this site with my Collectable Radios site so it is accessible from there. The Radio site covers a number of commercial and military collectable sets and its URL is

http://www.zipworld.com.au/~sb/radio/

To go direct to the R1155 section, which has been updated over the past months, go to

http://www.zipworld.com.au/~sb/radio/r1155.htm

The site covers photos of the gear, identifies varieties, has copies of original WWII instructional posters, schematics, component layouts and other information. Note that the old URL will also forward you to the new site.

Source record: 32696
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

R4C Receiver Ser #28314-Includes two filters, CW 1.5 and CW .5

T4XC Transmitter Ser#27861

MN 2000 Tuner Ser #5019

MS 4 Power Supply Speaker Ser#59736

This station is in perfect working order and comes with manuals for all units and with all the necessary, labeled patch cords.

All units have perfect faces. No scratches, rub marks or scratched crystals.

The units have some very minor scratches on the top and sides, but nothing that would be objectionable to a reasonable buyer.

The MN2000 has some rub wear on the left side of the cabinet.

The MS 4 has had two holes drilled in the top in order to mount some kind of equipment. I'm not sure what the equipment was. Photos are available for serious buyers.

These units must be professionally packaged with form-fitting foam packing to assure safe arrival. Buyer to pay all packaging, shipping and insurance costs.

Asking $850.00.

Rich W6VX

From: GregEMT1@netzero.com
Message-ID: <3eaacefc.228776997@news.earthlink.net>
Source record: 32698

I REALLY need to find a replacement mike for an HTX-10! If there is one out there, please let me know. I got one at RS, no box, docs, hardware, OR microphone, but it was cheap. I thought that I could order one from RS, but they say no. I have heard that this is actually the exact same as another brand of radio, but I am not sure of the brand. So if you do find another mic, maybe you will not need your old one? (hi hi)

I'm wondering if there is a long-term problem with internal sag in storing any types of tubes on their sides? What about old, tall ones like e.g. 803s, 211s? Single-anode-support ones like the various Eimac triodes?

73,
Mike, KK6GM

Hello everyone --

I'm looking for a 3 section variable capacitor for a Hallicrafters S-20R. It's a 3 section 12.5-410 pf with a second shaft that is attached to bandspread rotors. They were made by Oak Manufacturing in the 40's and 50's and the part number is 48B045.

I'd sure appreciate it if someone could point me in the right direction to locate one. I'd like to get the S-20R back in shape.

Please reply via email to jcamp2@cox.net.

Thaks and 73,
Jeff

From: Al Waschka <awaschka@bellsouth.net>
Message-ID: <3EABF7C1.784487DE@bellsouth.net>
Source record: 32717

I have two coils (80m and 20m) for a 1960's mobile antenna. It was, I believe the first commercial center-loaded antenna. I am looking for additional parts, or information to allow me to fabricate them. The top section was, I believe, a standard SS whip. That should be no problem, if I knew the dimension to cut one to. But I need a base section, or the dimensions for same. It is my intent to restore one of my original mobile stations, a Galaxy III transceiver in a 70's vintage automobile.

Thanks,

AL K5TAN

# 2952. WWII Navy "RCH" Receiver Spare Parts Kit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-28 01:42:09 UTC
From: Larry Johnson <larryj@teleport.com>
Message-ID: <3EAC804A.DB1DD2E8@teleport.com>
Source record: 32726

I just recently picked up a complete spare parts kit for an old WWII E. H. Scott Navy Model RCH HF Receiver. It appears to be complete, and looks like it would be enough to just about make a complete spare receiver! It has a service manual, tubes, coils, capacitors, etc. etc. I'm guessing that the factory shipped out these spare parts kits to military service depots as part of the contract when they sold receivers to Uncle Sam.

Anyone have any idea what this might be worth before it goes to ebay? It's all in a factory, metal box, about the size of a toolbox, and is well organized, completely full, and packed tight. It doesn't look like much of anything has been used, except for a couple of parts taken out of boxes to see what they look like. I can send a .jpg picture to anyone interested.

Thanks,
Larry

Here's a picture of a complete RCH receiver in WD8BIL's shack (thanks, WD8BIL!):

I have a S-108 receiver that is a fixer-upper for sale. The circuits under the chassis are in good shape and the upper part of the chassis has some rust spots and needs cleaned up. The case needs repainting and the recever does not work, but shouldn`t take too much to get it going ( the tube filiments light and it has high voltage), I just have too many projects right now. If interested I can e-mail pictures. Make a resonable offer! Thank`s, Rob

A parts radio would be fine. I unsoldered the capacitor tonight and examined it. The pieces that hold the rotors in place are broken. It looks like they're made out of small pieces of circuit board and are located at the top and bottom of each section. I'm sure I could make a couple of them with the Dremel, but I don't know if I could ever get the rotors lined up correctly.

73,
Jeff

# 2957. FS: Nye Viking Antenna Tuner

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-28 05:12:13 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <NK2ra.43424$ey1.4044418@newsread1.prod.itd.earthlink.net>
Source record: 32730
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

The MB-V-A Nye Viking tuner will handle power in excess of 3000 watts PEP sideband and CW with a continuous rating of 1500 watts into loads between 40 and 2000 ohms impedance with an SWR reading below 1.1:1.
A 3KW trifilar wound broadband balun provides balanced output to twin lead feeders 100 to 1000 ohms resistance and unbalanced output impedance down to 20 ohms at the Coax "A" and "B" outputs.
The unit features 2 1/4" tuning knobs with 4" dials; a 1 to 25 vernier readout over 360 degrees on the variable inductor tuning plus 360 degree readout on the variable capacitor. The extra heavy gauge aluminum cabinet provides adequate shielding.
The input connector from the transmitter or linear amplifier is a standard SO-239 UHF connector and the output terminals are high voltage porcelain feed-thrus and SO239 Delrin UHF coax connectors for 50 or 72 ohm coaxial cables.

Frequency range is 3.5 to 30 MHz with limited coverage of the 1.8-2.0 band segment
The size is 14 1/2" wide, 6 3/4 high and 12 1/4" deep.
Shipping weight is 20 pounds.

This unit has a few scratches on the top of the cabinet, so I cannot call it excellent, but scratches don't hurt the performance of this very high quality, high power tuner.

I am asking $650.00 plus packaging/shipping.

My guess is you will get an offer of a parts-donor S20R.
I just got one, but it's in too good a shape to hack it for parts (he says,
without yet having tested the power trans, the IFs, etc. :-)

Seems good to me. They are available for a little less than that at
Fair Radio in Ohio (http://www.fairradio.com) asks USD 395 for the
radio (Tested and checked), USD 17 for the manual and speaker for USD
21. The radio has substitute knobs and meter.

Those costs plus shipping to the UK would be over $450. It's not a
great price but it is "OK" I don't know of a European source for the
R-392.

One thing to remember is that the R-392 runs on 24 volts. You will
need to factor in the cost of a power supply- either a couple of
storage batteries or some kind of AC mains supply.

My pleasure. I've owned an R-392 (as well as a couple of 390s and
390As and something called a URR-5) and it was a lot of fun. Fair has
the matching transmitter for the 392 (and your Eurosource probably does
too) if you are a ham who does CW. The radio's a toughie!

Jeff

# 2972. Atlas low power on 3 bands

Source record: 32596
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Description: 1 kW solid state amp with integrated fully automatic antenna tuner. 160-12 meter bands, easy mod for 10 meter band. FULLY controlled by Icom transceivers for seamless operation. Remote control head compliments and places next to transceiver while main unit is out of the way on casters (wheels). This amp was made from approximately 1990 to 1996-97.

Control head is in perfect condition, no scratches. Amp and power supply (which sit on the floor or under the desk) has some scuff marks.

Perfect working order. Control head weighs 6 lbs., Linear weighs 80 pounds. Crating weight will determine the actual shipping weight. This amp will be professionally boxed (3 boxes) in custom form-fitting foam.

Asking $3500.00 plus shipping/insurance.

Is this true into a dummy load? The SWR monitor circuit may be
limiting your output.

Alternatively, one of the coupling or bypass caps may have opened,
causing problems at lower frequencies. For example, coupling caps
C501 or C504 could certainly cause this kind of a problem if they
opened or dramatically dropped in value. C512 might also be suspect.
Other bypass caps are possible candidates.

Is this a recent problem or has it been there since you got the set?
It may be that one of the caps is the wrong value.

Well, I don't know. I paid only $125 for a fairly nice one about 8 years ago at the Elgin IL RadioFest. In perfect working order and quite clean inside, original glow-in-dark meter and knobs. However, there were no connectors or speaker with it, so I have had to stick individual power and speaker leads onto the pins in the right-side connector. Luckily you don't need to interface the "goose bumps" connector.

I forget whether or not the seller threw in the AC PS I use -- it's from some Motorola VHF transceiver. Last time I checked the Fair Radio catalog, it seemed they would sell the funny connectors only with the radio, but then I didn't call up and ask nicely.

It's a great radio, ugly on the outside but absolutely beautiful inside. Audio won't win any prizes, but otherwise it's like an R-390.

There's a trick you can do with the power supply -- actually, two tricks. There are separate connector pins for A (heater) and B+ (plate). You can feed a few volts more than the 28 VDC to the plate for possibly improved performance, but don't overdo it, maybe 35V. Also, if you DON'T have the solid-state module substitute for the audio output tube, you can feed 28 VAC to the heaters, thus requiring a much easier to find B+ supply (maybe 1 Amp).

Source record: 32600
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Does anyone know where I could get the manual for a Plantronics DX10 avionics HF radio?
It is a vintage radio from the late sixties, AM only though 12 crystal controlled channels.
It appears to me that it actually originates from SunAir, given the applied construction techniques and the fact that the ID plate mentions Ft Lauderdale, FL

If you have more information, let me know, thanks!

# 2978. Re: Wtd Info: BC-191/375 Xtal Control

Message-ID: <THudndonI4xULDOjXTWcqg@comcast.com>
Source record: 32601

Interesting - I've never heard of this option for the BC-191/375. I really wonder if it would add any value though, as the original MO tuning is very accurate and rock-solid, considering the vintage of the design.

The BC-191(BC-375) oscillator is a high-level oscillator though, so if you would want to modify a 191 (0r 375) for external frequency control, you have to change the original VT-4 oscillator into a driver stage.
To me , that would be a real sin, to modify such a nice transmitter for that kind of operation. Like I said, it works just great the way it is!

If you only would want to do this mod to be certain about the frequency as it is being transmitted by the radio, just use a low-cost frequency counter to pick up some of the radiated energy. That will do the job.

# 2982. Ten-Tec Triton II Station FS or TRADE - needs some work

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-04-30 01:12:31 UTC
From: "abel5228@bellsouth.net" <w4udx@nospamjuno.com>
Message-ID: <sjFra.44594$sC.26529@fe06.atl2.webusenet.com>
Source record: 32604
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

For Sale:
Ten-Tec Triton II 100 watt HF station. In nice shape, and includes the matching power supply / speaker with built-in VOX option. Also has the CW active audio filter option in the radio. Includes photocopy manual and original hand mike. The radio receives but is weak. The front end is a common 40823 (40673) dual gate FET. I bought a new one from Mouser electronics and installed it and it did not help. I was then informed that it is a static-sensitive device. I took no precautions so I probably fried the FET. Anyway, it has the calibrator, the dial has been restrung, it has new dial lamps, and the transmit puts out around 75 to 80 watts. The power supply is fine. I am tired of fooling with it. I bought it off eBay and thought it would just need an alignment. I paid $125 plus shipping for this outfit, have put another $35 in parts (+ shipping). I will take any REASONABLE offer that minimizes my losses or would be open to trades. I am interested in QRP and finding another Yaesu FT-7, HTX-100 or maybe an HW-8 radio. Shoot me an email with an offer.... I have the original eBay picture.

I will be on vacation from May 2 to May 12th. If you email me during this time please be patient.

Thanks!
Mark W4UDX

That URR-41/R-648 was also a cool receiver. About the size of a BC-348,
with more modern tubes, and a couple of mechanical filters. Mechanical
digital readout like the R-390 receivers. Fair Radio Sales used to sell
them a few years back.

Have BC-222/322 bag BG-71, green version.
Very nice condition.
All straps, buckles and snap buttons in good shape.
Zipper excellent.
All fabric clean and strong- a couple of spots
where the color is lightened. Leather also in good shape.
Carrying straps present and complete.
Photos on request.

Will trade for a complete TBY bag
in similarly good, clean and complete condition.
Please- no missing pieces, rotten fabric or big holes.
A few blemishes OK- please send photos.

Thanks.

Good point. Since I almost never operate below 20 meters, this didn't
occur to me. It's a more likely scenario than the capacitor problem
which I mentioned.

This month's FLYPAST magazine shows the Collings Foundation's latest restoration. A Navy single pilot torpedo bomber with an ART 13 installed. I think it was a TBM. They also fly an F4 Phantom jet fighter. How did civilians get a working ex USAF F4? Wonder if it has any boatanchor gear aboard?

I got to skydive from their B 24 in 2000. Dropped out through the bomb bay over Quincy Illinois. It had all the right radio gear, BC 375, BC 348 etc., but none of it was hooked up, just mounted with no plugs. Hope to jump from their B 17 in August see: www.freefall.com.

There will also be a C 130A jumpship working the freefall convention this August in Rantoul Illinois. Its an oldie, ex RAAF with 3 bladed props, built in the 1950s It had some military avionics and nav gear installed last year when I flew in it. I think it had an ARC 27 UHF still aboard.

# 3005. Re: FT-980 Gen. TX (MARS) Kit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-01 17:47:55 UTC
From: SCR300 <scr300@comcast.net>
Message-ID: <c9ycnafi_5RSwCyjXTWcoQ@comcast.com>
Source record: 32628

Many years ago, I performed this mod with the exact kit you are looking for. The problem with it is that the FT-980 radio has dedicated bandfilters in the receiver RF stage only for the ham bands.

To circumvent that, this mod basically places a wideband amplifier (which is what the kit is) between the antenna and the mixer for all other frequencies than the ham bands. The result is a very poor strong-signal performance for the receiver on those "out-of-ham" frequencies, so my advice is to spare yourself the money and effort.

If you find the kit and want to perform it anyway: The amplifier in the kit has too much gain. As the amplifier is also used in the transmitter path for GenTX, this too-high gain problem causes parasitic oscillations, very nasty. I eliminated that by lowering the gain placing a resistor somewhere in the amp (don't ask me where exactly; it is too long ago)

To sum it up, the FT-980 was never really designed for GenTX operation. Although the kit is an original Yaesu component, it doesn't really fix that problem.

Hope this helps

SCR300

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. IN addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits.

Serial number 11590.

This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 3CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965.

Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer.

Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight.

Local pickup in Southern California (Los Angeles area) is preferred.

Asking $3250.00 plus shipping.

Ok the latest tangent for a future display are:

Home Broadcasters, Phone Oscillators and Babysitters!

looking for the actual items of course, but to go along with that, advertisements, and some first hand oral history about your early experiences and fun and trouble you got into etc etc regarding these devices!

It would be interesting to now how many folks that enjoyed these went into some form of broadcasting.....

Three that I remember myself were the

knight kit little blue unit with the 50c5's in it ( had loads of fun with one of these! This baby would be fun to play with again!)

the RCA Unit ( I almost remember this having a pentode or a pentagrid tube in it.....

Lafayette unit... Did not have one but always looked in the catalog at it.

Was there also a heathkit unit? I seem to think so but a catalog check will fill in the details of it's existence.

a close brother to the home broadcaster was the 'baby sitter' and knew people when I was young that kludged extra inputs and preamps onto these.....

Yep want examples of all of them! cash, trade, free... whatever!

But most of all want some history of peoples involvement with them to add to the section on the web site.

please contact me off list.

Thanks Ed Sharpe archivist for SMECC

Sure. Peter Dahl Co. in Texas will rewind modulation transformers, usually
for a lot less than the cost of a new one but usually a lot more than the
cost of a hamfest one.

You'd probably need something like 750 to 850 volt secondaries running a
fw bridge.

6.3 volts for the tube heaters in parallel.
12.6 for two series tube heater strings.

Hopefully an additional 12 or 24 volt winding for some control
electronics and lights.

You can find some circuit improvements for said amplifier by using my
Dentron GLA-1000 text on the http://sonic.ucdavis.edu amateur radio page.
There's even an LA-1000 amp diagram/manual down load available.

Replacement transformers are available through peter dahl and similar
sources. I'd hunt around some of the Amateur Flea Markets first. I've
also got a source of similar hypersil type xmfrs, but none of them will be
real cheap.

cheers
skipp

From: "Roger D. Johnson" <n1rj@pivot.net>
Message-ID: <3EB30D2C.9090409@pivot.net>
Source record: 32496

Technically, an oscillator is just a circuit for generating
an AC waveform. A signal generator has an oscillator as it's
heart but usually has additional circuits such as a buffer
amplifier to isolate the oscillator from load changes, a
modulator to add a tone(s) to the generated signal, power
supply, and output attenuator. Some are metered for better
accuracy, have additional circuits, etc.

RE: Need alignment: Heathkit SB-401 / SB-303.

Is their anyone experienced with realigning / cleaning the switches / replacing parts (if required) etc., on my Heathkit SB-401 / SB-303 interconnected TX / RX pair? They worked fine until they were left alone for 4 or 5 years. Now they aren't quite right. But they are functioning.

I would like them gone through from head to toe. I'm not looking for bargain basement prices --- I want it done right.

I am in Ottawa Ontario Canada. Please email me if you can help or know of a place that can do this right.

Thanks,
-- Rob Myers

Please don't post this to every amateur radio newsgroup. Just post it to the more relevant ones. This particular group is about vintage equipment NOT morse code or general operating or policies.

It is on the agenda but there is no guarantee that they will get around to voting on it. The agenda is quite lengthy and they don't get to everything. This has happened before. Until there is a vote, there is no way to even guess what will happen. Even if the world conference votes to drop it, there will be an additional lag for implementation. Also keep in mind that even if the international requirement is dropped, each individual country can decide to keep it for their specific licensing requirements. Some countries have already stated that they plan on keeping it no matter what. Here in the US, the FCC would put out a Notice for Proposed Rulemaking and allow time for comments. Then decide on whether to drop it or not and decide on an implementation time.

So don't hold your breath or wait around. It's many months away if it happens at all. Instead, learn that 5wpm. It takes about 30 hours for the average person to achieve this. Some take less, some take more. So get one of the good computer programs, practice an hour a day (break it into 15 to 30 minute sessions though for best results) and you could be on the air in a few weeks instead of waiting months or even years.

With the sunspot cycle heading downhill, good conditions on the bands will become less frequent. So waiting is wasting time.

Good luck,
Dee D. Flint, N8UZE

Please take this to the appropriate newsgroup and don't cross-post with it (and lose the HTML...it doesn't belong in newsgroups). This has been hashed out ad infinitum on other groups ever since the no-code tech came out over ten years ago.

Get over it, people. It isn't the end of the world.

And, no, I'm not a no-coder. I've been licensed since before most of you were born. I took my code tests in front of a steely-eyed FCC examiner.

Please take this disussion elsewhere...

Source record: 32507

The kit that Yaesu sold was no good due to the filters in the ham VFO circuit. Now Yaesu says they have no knowledge of this kit.

There is a mod that works reasonably well in the old Fox Tango Newsletter. A copy has been supplied to K2PW. Mine works fine and signals are almost the same between the two VFO's.

You must not be a beginner and you should have some knowledge of how a transceiver works to attempt the mod. The FT 980 is far too complicated to tackle the mod otherwise.

## 3035. Surface Mount Soldering Station?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-03 22:06:12 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3EB43D54.E7FA30CC@ix.netcom.com>

Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

Anyone know where I can find a used surface mount soldering station,
like the "hot air" kind? Can't afford a new one- hoping for
surplus or trade.

Alignment data comes with each individual manual,telling what equipment to use ,where to connect etc.After about 60 years in communications I find that alignment is not a problem ,unless someone has tinkered with the golden screwdriver.. tuned circuits never de tune themselves very much,generally a touchup is about all they ever need, owners manual usually shows the rf adjustments for each band and order of tuning..IF adjustments hardly ever need anything..Most cases if a tube rec is weak ,it is a tube problem..or dirty sockets band switches relays etc.. to answer your question ,,,Antique Electronics supply has a good selection of service books on old stuff...WWW.tubesandmore.com good luck Harold W4PQW 73

# 3039. S-38 BFO Coil

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-03 23:35:05 UTC
From: Steve McDonald <jsm@gulfislands.com>
Message-ID: <vb8jt1t5f4hm02@corp.supernews.com>
Source record: 32512

Does anyone know how this coil is configured? The schematic shows it (T6) as a tapped coil (slug-tuned) but it appears to be a little more complex than this. I am unable to get the 12SQ7 BFO to oscillate and I suspect the coil has been connected incorrectly as there are indications that some re-wiring has taken place. Perhaps the coil is fine but the wiring to the pins is incorrect. Looking at the coil end, there are three pins, going counterclockwise, at 12, 9 and 6 o'clock. I naturally assumed that 12 and 6 were the main coil and 9 was the tap (as did the previous owner it appears) but now I am leaning towards 12 and 9 as the main with 6 the tap or perhaps a second winding altogether.
Any help appreciated!!

2-cents worth...

Doesn't discussion of CW have EVERYTHING to do with boatanchors? Why does this topic whip everyone up to a froth but, yet, guys prattle on and on about their precious AM operations and nobody seems to mind?

I obviously have no idea of when you sat before your steely-eyed examiner, but when I sat for my commercial tickets in the late 1960s they still were asking about quenched gap spark. Technology used to include knowing historically HOW WE GOT TO WHERE WE ARE TODAY and wasn't only involved in present-tense concepts.

But then again, none of this would be being discussed had the ham license not been diluted into what it has become.

Indeed it has become the way of life in this age to not require a single ounce more of knowledge about anything other than that which is minimally necessary to achieve some end.

Unfortunately I fear we can be assured that the one-world order idiots will vote to eliminate CW from HF requirements. But don't think they will stop there. Corporate interests are what drives everything, not governments or treaties. Period. When the charlatans and thieves finish raping the CW requirements, they will continue their onslaught by total elimination of licensing altogether. They are only interested in selling and harvesting for profit; whether we're talking about selling radio equipment, harvesting spectrum or auctioning frequencies to the highest bidder.

Enjoy ham radio while you can, gentlemen. What is happening to CW is sadly a precursor of what's to come. And we CW aficionados aren't the only ones who will lose. We all will.

Jack:

You can fix the weak audio by replacing all those 2 uF electrolytic
capacitors in the audio section. You should replace the other
electrolytics too, but those 2 uF jobs are the weak audio problem.

ZZ posted in part:
<< Please take this disussion elsewhere... >>

It might help if off-topic posts were designated OT in the subject line so sensitive people such as yourself could ignore them. But the problem is, even when YOU know it's off-topic, you take time to read it and respond.......

I don't think the subject was too off-topic, and it is interesting. Just because YOU are bored to death with the subject, having followed it for years elsewhere, doesn't mean others won't find it interesting. I wasn't aware of the recent international discussion to drop the code entirely, though I am aware of the potential for doing that. Yep! That was interesting. I heard it first, here.

As to your license antiquity, good for you. I'm an old-timer too. Got my tickets over 50 years ago. That and $1.50 might get us a cuppa coffee. It doesn't get us an additional 10 votes.

You sound a bit emotional about the status of CW. No, it isn't the end of the world. So what do you think about enhanced SSB?

Don

Depending on how much work you are planning to do, the Weller
butane fired mini torches with the catalytic "hot air" tip will
suffice. They are fine for the occasional installation of a new
part. Not so great for removing an old part if it has a lot of
leads....better in that case to destroy the old part.

TUBES AVAILABLE

I have a very good selection of tubes for HAM/CB/Audio/Antique/Transmitting
100,000+ NOS USA tubes in stock

I do not have a web site nor a formal price list ~~ Suggest that you Email
me with the tubes that you need, along with the quantity of each tube, and I
will check my current inventory and get back to you with availability and a
quote.

This is my only business, it is not a hobby, so I strive to supply quality
tubes at a very competitive price.

I have very few of the 'high end' audio tubes, but do have a good selection
of all others.

Specialize in sweep, transmitting and ceramic tubes.

Please Email you needs to:
thetubeman@earthlink.net

Thank you for your consideration

Need replacement cables for older HP test equipment, checkout our website:
http://www.glkinst.com/cables/hp_cables.htm

We offer many replacement cables for the HP 141T spectrum analyzer system, including tracking generators, tracking filters, extender cables, storage normalizers, etc. Many cables will work with the 8505A network analyzer too. Also, RF and I/O interconnect cables are available for the 8566, 8567, and 8568 A/B spectrum analyzers. Part numbers 85662-60093 and 85662-60094. The list of cables for the 141T system include:

HP 8443A/B, 100 KHz to 110 MHz Tracking Generator to 141T/8553B Display Aux. A, P/N 08443-60009

HP 8444A, 500 KHz to 1250 MHz Tracking Generator to 141T/8555A Display Aux. A , P/N 08444-60017

HP 8445B, 1.8 GHz to 18 GHz Tracking Filter to 141T/8555A Display Aux. B, P/N 08445-60007

HP 50 Ohm Termination for 141T/8553B/8555A Aux. A, P/N 08553-60122

Extender Service Cable for RF to IF Plugin, P/N 11592-60016
Extender Service Cable for 140/141 Display to RF/IF Plugin Units, P/N 11592-60015

HP 8501A, Storage Normalizer to HP 8505A Network, P/N 08501-60067

HP 8750A, Storage Normalizer, P/N 08750-60034
P/N 08750-60035 option 001 w/BNCs

Details can be found on our website at:

Thanks Mike - the radio is a U.S. one. The cathode goes directly to ground; the tap on the coil also goes directly to ground. Do you have one of these 6 tubers?

I have one of the S 38 plain and simple 6-tubers upside down
and open on my bench right now, where it has been for 2 months. It was in
ghastly shape when it was given to me and even the original wiring did not
conform to the conventional schematic, let alone "updates" performed by some
anonymous saboteur. What you are describing to me is NOT a "tapped coil".
It is probably TWO coils, one wound over the other for feedback . with a
common ground lug. Now I have attempted to help people on the ngs before,
but my voice of sweet reason and technical excellence gets drowned out by
the braying of numerous arrl/rac type die-hards who just cannot accept that
an independent, non-affiliated researcher would have something worthwhile to
offer that is not found in the index to the Infallible Handbook. They don't
get under my skin but they do poison the atmosphere to the extent that
confidence in my expertise is undermined and persons seeking help get turned
off. My S 38 is now working very well ... if you have an ohm-meter, measure
the BFO coil resistance to ground from each of the two "outside" lugs. If
one is around 3 ohms and the other around 13 ohms, I believe I have your
circuit. Better answer me on metrovan or direct otherwise the yammering is
likely to start up. 73 miki (not mike) VE7AFN.

Source record: 32540

I have for sale a nice Kenwood TM-2570A 2 Meter FM Transceiver. This transceiver is in very nice shape and works fine except that the volume control only works in one spot-- almost full open!!! Loud. I have tried to clean it, but it is sealed. It will have to be replaced. Otherwise this is a great little mobile 2 meter radio and it has the hard to fine TU7 Tone Board. It includes the original box, the manual, the mic, and the mobile bracket. It puts out 70 watts or 5 watts. It has been used very little. The dial lights all work. It would make a fine transceiver for someone who has the skills to change out a $2.00 part. Not me, though. Price is $75.
Thanks, Charlie Hugg, K5MBX

We may have a new, better shipping tool.
Mailboxes, Etc. has been acquired by UPS and will be
reopened as "The UPS Store." They promise much lower prices
plus UPS services. While I'm not partial to United Parcel Smashers,
perhaps they will improve with the new business.

I checked out my local one. There's a small additional cost compared to
taking a parcel directly to a UPS customer counter, but for many people
the convenience will be worth the cost.

At my local Mail-It-4U shop, there is QUITE a large markup for taking a package there, as opposed to calling up UPS and having them come pick it up. This is based on mailing a pair of BC-348s (two boxes) at the store, and later shipping an NCX-5 (ACPS in separate box) via UPS home pickup. If you know you're going to be home and available, it's hard to beat. You can set it up over hte phone or the Web.

Now, a genuine UPS store, that markup might indeed be minimal. Let's hope so.

This is sorta old news in that UPS has owned an interest
in Mail Boxes Etc. for some time. The new thing is that
UPS bought them out completely. If you are an infrequent shipper and don't
mind paying a premium for
so so packing, then it's not to bad. If you ship stuff
very often, then you are better off to find a good
packaging supply store and buy the boxes, bubble wrap,
tape, etc yourself. Another thing, Fed-X ground is
cheaper than UPS and generally faster.

That happened in our town a few months ago. I went to the new UPS Store a couple of times, but didn't hit it off with the individuals working there, and have taken my biz to another mailboxes type place across the street. I don't ship things often enough (or pay close enough attention) to know whether their UPS rates were lower than before. My casual impression was, "Hm, seems about the same."

I am still waiting for the miraculous day when one of these outfits installs some little computer terminals that let you enter the address, etc., information by yourself. That would save the delay involved in you filling out a paper form, then standing around while the clerk laboriously retypes everything you just wrote down, then having to proofread the labels to make sure that the clerk didn't mistype the information that you entered on paper five minutes earlier :-(

Next UPS will change its name to "Amalgamated Conglomerates Corp.",
and buy everything else.

I have a Hallicrafter SX-110 transceiver with matching speaker for sale. It is in good working condition and in very good condition cosmetically, with only nomrmal wear and no big scratches or dents. The only thing missing is a small knob on the left that trims the antenna. I bought this radio from the original owner about 30 years ago and have used it ocassionally since then. Am asking $150 plus shipping. If you are seriously interested in the item send an email and ask for a .jpeg. Or email me with any other questions you might have.

Folks:

I can't understand why any of you would take a box to the UPS counter to ship it. Let alone use a surcharging reseller of services (MBE et all)

The shipping Line, and BS from counter workers about "minimum packaging requirements", then opening your skillfully packed item is asinine.

Three years ago I opened a UPS account. Yes, a real UPS account from my home, using their 800-pickups number. My volume is only four or five items per year, and mostly around Christmas time. I call it in the night before, and a driver arrives the next day to attach the shipping label; generated from my call the night before. I was given an account to bill to, and receive a billing statement at the end of the month.

It is known as the one-time-pickup service. And it is cheaper than the UPS company counter rate. And much cheaper than the resellers.

Go for it. You will thank me when you use your very own account during the holidays.

Try FedEx Ground. Typically they are 30% cheaper than UPS. And they seem to have a better reputation for delivering undamaged goods, although this is merely anecdotal. I use FedEx Ground for anything that weighs more than 2 lbs. USPS Priority Mail is cheapest for light stuff.

Since nobody else has let you know, I might as well. The SX-110 is only a receiver, not a transceiver. A good clue is the absence of a microphone jack!

Probably, the most crooked Mailboxes Etc. that I've ever run into was the one in Cedar Rapids, Iowa. I shipped a couple of packages out through them, and even having my own printed (30 Font) labels, they insisted that I buy their own hand printed (read miniature print); otherwise, they would not insure the shipment. For those of you in the Cedar Rapids area, this is the one on Edgewood.

You can setup your own computer UPS shipping system now. You just need
a internet connection and a major credit card. It even prints the
shipping label and bills your credit card.

The ones from WWII will bring about $10-$14 on Ebay for an entire
year in good condion (i.e., all 12 issues of 1944).
Less than a dollar each if they are unmatched 1942-45.
The ones from the 50s are good for lining the bottoms
of bird cages or filling the last bit of the paper
recycle bin. The QST CDs have about done in the paper stuff.

Not much will be better, but some things. MBE marked up 35% if I recall right... so without that the prices will be lower but something tells me the franchise owners have to get their cut... what that will be exactly I dont know yet.

Insurance claims will be much smoother... but something tells me...

Handling has become SO BAD! and it wont get any better. Ive decided to switch to FEDEX for all my console shipping.... its more $$ but in the end the customer will be much happier paying a little more and getting a package in one piece.

Actually, what UPS did was increase the charges for "one-time-pickup."
I think this was to cover the cost of the new stores and to keep from
having to handle pickup calls. With the pickup fee, UPS ground is about
the same (within a buck or 2) as FedEx 3day air. At least for packages
less than about 10 pounds. We use FedEx all the time now unless a customer
has specific needs.

The store in Clairement Square in San Diego was worst. They wanted over $24 to ship a package by ground to San Jose. I only paid $6.30 to have it shipped by UPS ground from San Jose; same item, same box, same weight. No amount of arguing or showing the USP rate (receipt) did any good. I finally took it the local UPS counter and paid about $8. Still too high, but a lot cheaper than $24.00. I now have a Fedex account and don't bother with stores or UPS. I have shipped all over the US and to many foreign countries with Fedex without any problems. USPS Priority and Global Priority Mail are excellent too.

Ex-mailboxes etc. comes to your house and picks up the items you
*should* have been selling on Ebay. While you're not home. You
don't notice this until notified you have money in your Paypal account.
Which you didn't know you had.

The 1940's if in very good shape and complete with all cover will sell on ebay for about $20 to $25/compete year. and the 50's will bring from $10 to $15 / for a complete year if again in good shape. I do not know how these are selling at swap mets among the non computer HAM's but I expect maybe about the same and maybe lower.

At my local Mail-It-4U shop, there is QUITE a large markup for taking a package there, as opposed to calling up UPS and having them come pick it up. This is based on mailing a pair of BC-348s (two boxes) at the store, and later shipping an NCX-5 (ACPS in separate box) via UPS home pickup. If you know you're going to be home and available, it's hard to beat. You can set it up over hte phone or the Web.

Now, a genuine UPS store, that markup might indeed be minimal. Let's hope so.

# 3116. Anyone in Orlando or Pensacola? Need driving advice

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-06 16:09:52 UTC
From: Dave <Unsolicitedmale@hotmail.com>
Message-ID: <3eb7de64$1_8@news.meganetnews.com>
Source record: 32589

Hi,

A little off topic, but I'm figuring that some of my ham brethren out there can lend me a hand.

I'm going to be driving from Orlando to Meridian, Mississippi next month and I have some questions. So I'm looking for a 'local' who can advise me on the toll roads and turnpike situation as it's so different from place to place. Also seeking some route advice which I'll describe via email.

Please reply via EMAIL ONLY - not on the NG, for the sake of others.

Use this address (my 'spam address') and I'll reply with a different address when you contact me.

Dave Ellison WB7AWK
unsolicitedmale@hotmail.com

Thanks and best of 73 to all,

Dave

Yes, this is what I used to ship an NCX-5 in two boxes. Convenient, and much
cheaper. You can also set up the transaction over a Web site.

The only catch is you have to be at home when the UPS man comes by to pick up.
OK for us retirees. --Mike K. AA1UK

From: martyna@direcway.com
Message-ID: <b98v7i$6d3$1@news.netmar.com>
Source record: 32394

I have just received my fine receiver, I am going to refinish the cabinet
and upon removal of the chassis from the cabinet I came across a ferrite
bar.
Now I can see where these are used to resonate the band selected but my
question is,,,, how on earth am I going to find where this came from??
Any advise would be appreciated
You can e mail me direct at
martyna@direcway.com
Many thanks gentlemen.

Source record: 32397
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Here are two low-cost radios that will make a great project for someone who is looking for 2M and 440 capabilities.

I have one Icom IC28A (2M) and one IC48A (440) radio. The radios come with manuals/schematics, mike, and power cords. The 2M radio has a mobile bracket included.

These radios are in good working order but need some soap-and-water cleanup to make them look pretty. The IC48A has a one-inch rub mark on top that can easily be painted. The IC28A has a sticky on/off switch that should work fine with a little contact cleaner.

I tested these radios. They put out full power and both receive well.

Only $100.00 for both radios, plus shipping.

Source record: 32401

Here are some microphones and keys for sale. Prices do not include
shipping unless
specified.

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$40
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in
excellent
condition.

Photos:
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

Astatic DN-500 Bullet Microphoneï¿½ï¿½ï¿½..$45
I am not sure if this is the original finish or not as I have never seen
one in gray. The unit is in very good condition with no major scrapes or
dings. It has been tested and sounds good. The chrome is nice and
un-pitted. The connector is a 3 prong Amphenol. This microphone fits
into my type "G" and "UGB" Astatic D-104 Microphone stands
Photos:
http://members.cox.net/radiostuff9/bulletmike.jpg
http://members.cox.net/radiostuff9/bulletmike2.jpg
http://members.cox.net/radiostuff9/connector.jpg

E.F. Johnson Base Station Microphoneï¿½ï¿½..$25 plus shipping
Good condition and working. Has a modular (telephone-type)connector.

Photos:
http://members.cox.net/radiostuff9/johnsonmike2.jpg

Vibroplex Black Base Original.....$80 plus shipping
The serial number is 134612 which dates it to 1944 and manufacture in
New York City. This bug needs a good cleaning. It is missing the weights
and one of the terminal screws. Replacements parts are available from
Vibroplex.

Photos:
http://members.cox.net/radiostuff9/vibroplex_original.jpg
http://members.cox.net/radiostuff9/vibroplex_original2.jpg

U.S. Army Signal Corps Flame Proof Key J-5-Aï¿½ï¿½ï¿½.$75 plus shipping
Flame Proof Key J-5-A made by L.S. Brach Mfg. of Newark, NJ. This is a
W.W.II key in very good condition.

Photos:
http://members.cox.net/radiostuff9/flameproofkey.jpg
http://members.cox.net/radiostuff9/flameproofkey2.jpg

I will ship overseas.

Hi all,

I am looking for information for an HF receiver. The make is Marconi,
and the model is CSR2. I also would like the info on the matching power
supply if available. I have interrogated all the usual suspects in an
effort to find this info, but the CSR2 appears to have been a rare beast.

Any help will be very much appreciated.

cheers

Dear John:

Doing a Yahoo search, I found the following url:

http://www.nwtandy.rcsigs.ca/stations/yellowknife.htm

which mentions the CSR2 as being in service with the RCSigs at Yellowknife in 1937. So it's safe to say it's probably 1930's technology.

Seems to be produced for the Royal Canadian Corps of Signals
North West Territories and Yukon Territories Radio system.

http://www.rcsigs.ca/History/90YearsAndCounting/Chapter/4_2/

Also quotes the Yellowknife station.

http://www.nwtandy.rcsigs.ca/index.htm

History of the NWT&Y Radio system.

http://www.c-and-e-museum.org/te_tp5.htm

Another listing of the history and who finally took over the sites of the NWT&Y Radio System.

Probably the CanForces and the current system operators *may* have
some information.

Hope this helps....

That was quick! :)

These are good radios, I have a 28H and 38A (220), they're great
transceivers, even with the 3 PL tone limit.

73,

Hello Richard

May thanks for the reply. I had found the NWT&Y reference during earlier searches, but had not found the C&E Museum reference. That was a little bit more info to add to the pile. I have been to the canadian Forces, and received lots of help, but no info. Next I guess I'll try the Transportation and Communications as they took the whole thing over in the mid fifties.

thanks again

Source record: 32418

FS: Collins Broadcast 1 Kilowatt Modulator, from 20V transmitter. It contains the complete modulator deck, Mod transformer, extra 4-400 tubes, and choke. This would be a great start for a hombrew transmitter. It should fit in most racks with no problem. Also have schematic. Many caps and resistors have been replaced, needs little work to get operational. This was removed from a working back up transmitter and has been in storage for a few years.
See pictures @

Now that's an esoteric ol' BA! This puppy was an USN rx, seeming 50 .cal - proof. Has sub-min tubes that soldered in - uh-huh, tin cans were quite the rough ride, heheheh. These units seem to be kinda rare, and I'd like to see a thread discussing them, so I may learn more. For example, they're mounted on a pull-out slider that, when extended, may rotate the unit up or down by 45-90 degrees to work on the top or bottom whilst hanging in the rack. Another feature seems to be that EVERY I/O seems to be filtered so that only the intended signal will pass that port in and/or out of the receiver. Becha this puppy wasn't bothered by other noise/transmission sources nearby, as certainly there was aboard ship many other RF emitters.

Takers, 1-2-3, GO . . .

...-.-

## 3148. Hammarlund 129X owners.....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-08 06:47:30 UTC
From: dxlover <dxlover@adelphia.net>
Message-ID: <64nua.14103$hT2.5676576@news2.news.adelphia.net>
Source record: 32421

I have had a problem for about a month now, the 129X has no audio nor is the signal meter picking up anything. :-(

I had originally thought that the 'Voltage Regulator' aka 0C3/VR105 was bad. Is it normal for that tube to do 'nothing' when on receive? Because that is what it's doing, but when I flip the switch to 'send'....I hear the 'static' of the switch flipping through the speakers and it lights up.

I went and ordered another one of the above mentioned tube and it still does the same.

Another question : When you are facing the receiver with the lid up, in the very back left hand corner, to the left of the 'Voltage Regulator' tube is a 'can' {?} Don't know what it's called, but it looks like a metal box and it has a little tube at the top of it. I noticed that this 'can/canister' was somewhat 'loose' in it's socket. That isn't normal is it? Well, I noticed that the little tube at the top of that canister was broke off, just the little tip, real small piece, I found the piece underneath that 'canister'......I saved it to maybe show some Elmer or someone if I can find anyone around here...lol.

Shouldn't that part be hot or at least warm? I'd think it would, but it isn't..it's cold actually. {?} Come to think of it, the two other 'canisters' before the one I have been talking about don't get warm either, is this normal?

I'm just learning on this piece guys, actually my first tube radio, so bear with me. Can someone that actually owns a 129X or knows one like the back of their hand give me some help, I REALLY miss listening to her. :-(

You can privately email me or just answer in this group. Any help to make her breathe again guys, would be appreciated.

If you need a manual, let me know. I had one of these
a few years back along with the LF version, the
SRR-11. The submin tubes are occasionally available
on eBay at reasonable prices.

On the manual, I scanned it into an Adobe .pdf file
and it covers the -11, -12, and -13. I can mail a CD
with this file as well as a bunch of other mil radio
manual .pdf files to any US address for $7.

thanks,
Phil

Used this particular receiver when I was a ship to shore CW operator in the USN at radio NBA in Panama, RP. Spent many an hour working through heavy QRM on a single frequency with a dozen shore stations working ships all over the world at

the same time. This receiver had incredible selectivity. Selectivity that other manufactures could only dream about. I preferred the SRR model hands down

over the R-390/A or anything else for that matter for working CW. 73 de Fred....

Message-ID: <YbBua.10523$JE3.590532@twister.rdc-kc.rr.com>
Source record: 32434

The rotor is an: Alliance Model 225

It uses 5 wires. One puts the control box pointer where he wants the beam, and the rotor goes there. There is no meter showing antenna position, just a red lite showing the rotor is "in transit" to a new location of the antenna. (the rotor and the antenna are un-aligned). When they again get back aligned, the red lite extinguishes.

Wiring diagram needed !

Please respond to jhilins@wi.rr.com

# 3162. Re: what single pilot aircraft had an ART 13 xmtr?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-08 22:57:02 UTC
From: Chris Bowne <radiobwn@riconnect.com>
Message-ID: <vblo5imut1m1c5@corp.supernews.com>
Source record: 32435

I believe that the TBM was a 3 place (person) plane. The ART was installed aft of the lower gunner/radio operator's position, facing forward. This position was on the bottom of the fuselage, with a small wrap around window , and a single 50 cal MG mount, firing aft and down. Saw a picture of the ART-13 in one of these in a book on the TBM at a hobby store.

The Collings Foundation has never been very interested in restoring the original radios to operation. I donated a BC-453 receiver to them many years ago, AFIK, its probably still sitting on a shelf somewhere. The B-24 command radios, which would be installed over the wing aft of the bomb bay, are not installed. It probably would not take a lot of work to get the liaison BC-375 and BC-348 working though!

A few years ago, a guy submitted an article to ER magazine describing how he operated the B-17's (Nine-Oh-Nine) radios on the ham bands while on a flight over Arizona. No way, except in his imagination.

My son Dave,who is presently deployed to the Gulf as an aircraft electrician with the 1109th AVCRAD (Aviation Classification and Repair Depot) got a free ride on the B-24 last fall when they were at Groton CT airport. Dave and another electrician from the AVCRAD went over to check out the plane after their weekend drill was dismissed and ended up fixing a problem they had with one of the main generator's voltage regulators. The Collings crew invited them up on the subsequent test flight, during which they shot some excellent photos with some throw-away cameras they brought with them. It's fun to look at those pictures next to ones I shot of him on the same plane as a little kid when it first started touring the country about 15 years ago! His section sergeant said that he was probably the first Army aircraft electrician to work on a 4 engine bomber since the Air Force was split off from the Army after WW2!

If your receiver is like most I own or have seen, the panel lettering is raised above the panel. You can very carefully apply white paint to them W/O getting any on the panel itself. At a minimum, you can carefully sand off any paint on the raised letters, to expose the silver colored aluminum underneath.

I believe Alliance rotors have a DC motor and a potentiometer. Therefore
they can be used with comparator-type boxes like the Genesis.

They cannot be used with the more common 2-phase AC motor type controls.

An ohmmeter should quickly tell you which two pins go to the motor and which
three to the potentiometer.

I've got an SRR-13 operating now. Just finished refurbishing it.
I used one on the USS Lansing DER388 in 1962.
R-390's and WRR-2's replaced the SRR-13
and RBC's in 1962. This one has Navy solid
state mods for the 6X4 rectifiers and for the
ballast resistor used in the first oscillator
filament circuitry. It's a fun receiver to use.

When you set the switch to Transmit, some of the load on the power supply is removed, which increases the voltage to the OC3 allowing it to ignite. It will glow under normal conditions. Something in the receiver is drawing too much current, but apparently not enough to blow the fuse. After-thought-> check to see that there is a fuse in the socket and that it is not bypassed by tinfoil or something else. You are going to need a meter or a lot of luck to find the problem.

I haven't owned an HQ129X for a long time, so I'm not sure, but I believe the unit in the left rear corner is a 100 kHz calibrator.

Don

I have one. What I heard is that these were used in the boats that the tin
cans were bouncing ash cans off of. As a bonus, with the radio room up
forward, this RX help the sub dive a lot faster (a quote from another owner).

> These units seem to be kinda rare, and I'd like to see
>a thread discussing them, so I may learn more. For example, they're mounted
>on a pull-out slider that, when extended, may rotate the unit up or down by

A very handy ability, in a crowded boat with no work table.
I bought mine mostly for its neat projection dial system. Unforch, these units
are famous for their poor dial tracking -- if you calibrate the set
(mechanically) at any point on the dial, it rapidly goes out elsewhere on the
scale. Also I've heard the RAF and LO stages don't track as well as they
should. Somehwere I have a copy of an article on a (very difficult) set of
mods you can make to fix this. It's hard because the 4-gang variable tuning
cap is sealed up tight on all 4 sides, and you have to drill and cut into the
box to add fixed mica padder caps.

The bandswitching linkage inside is really fun to watch. Quite different from
an R390.

>Another feature seems to be that EVERY I/O seems to be filtered so that only
>the intended signal will pass that port in and/or out of the receiver. Becha
>this puppy wasn't bothered by other noise/transmission sources nearby, as
>certainly there was aboard ship many other RF emitters.

Makes this set even more difficult to work on. But most late Navy sets (like
the R390) have heavy I/O filtering. They just have more room for it :-)

Mine must have a weak LO tube or something -- it tends to cut in and out in the
front end. 73, Mike K. AA1UK

## 3170. FS: Viking Valiant II

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-09 03:05:34 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <2WEua.62519$ey1.5587563@newsread1.prod.itd.earthlink.net>
Source record: 32443
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

The Viking Valiant II is a self-contained radio frequency transmitter designed for amateur service. CW/AM/SSB. CW-200w, AM-150w, SSB-150w PEP. 1.8 Mhz-29.7Mhz. 120v. operation. Serial #1448

This unit is in excellent working order but needs some paint work around the front of the unit. Complete manual included. I am not an expert on this equipment, but I know that this one works. Unit weighs 83 pounds so it must be shipped by truck. I would prefer local pickup in the Los Angeles area, but I will arrange for truck shipping and professional boxing using foam packing. Buyer pays all boxing/shipping/insurance/tracking.

Asking $300.00 plus shipping.

It doesn't really show up much in the history books, though I gather
it was significant at the time..

In 1995, CQ published some historical material in their January issue,
to commemorate their 50th anniversary. So this is from an article
entitled "Was There Life Before CQ" by Bill Orr. There might be
material in the 1964 series in QST to mark their 50th anniversary,
but likely it wouldn't be detailed. I'm sure Wayne Green has mentioned
"Radio" over the years, especially in the early days of 73, but I
can't think of any time when he actually wrote a detailed article.

The San Francisco Radio Club started the "Pacific Radio News" in
1917, apparently a slim magazine. It was a general radio magazine,
though in those early days there wasn't much of a dividing line
between amateur and the rest. In the late twenties it apparently
morphed into a trade magazine for the radio industry.

By 1929, it had shortened it's name to "Radio", and was having problems,
thanks to the depression. So in 1933, after a merger with "Modern Radio",
it refocused itself as an amateur radio magazine. It had some pretty well
known authors writing for it, and it would seem it was full of technical
articles.

In 1936, it merged with R/9, which apparently had better financial backing,
keeping the name "Radio". When WWII came along, the magazine suffered
due to obvious reasons, dwindling in size, and trying to attract a larger
readership by including articles about audio and elementary electronics.
It was sold in 1944 to John Potts and S. R. Cowan.

It was now subtitled "The Journal for Radio Electronic Engineers" and
was marketed to broadcast engineers. In May 1947, it was retitled "Audio
Engineering" with a focus on audio. In 1954, the name was shortened to
"Audio", which was in existence up till recent years (sometime in the
past decade). In it's later years, it was mainly a review magazine,
but had the occasional technical article, even sometimes a construction
article.

Cowan and Potts then went on to start CQ in 1945. (And of course,
Wayne Green was editor of CQ in the late fifties, and when he left
he started 73.)

There's a footnote referencing "Audio's 35th Birthday" by John Wolkonowicz
in the May 1982 issue of "Audio".

Source record: 32346

Bob,
I am in the process of restoring a couple of R390A's to original electrical condition and found the same low sensitivity on a couple of bands. The output of the 2nd crystal oscillator was low on those bands. Tuning helped a little, but the 6AK5 tube (V401) was the real culprit. Replaced it, and the sensitivity returned to specifications. Used a scope on J415 to peakup each band. The crystal may be bad, but I would check everything else first, including the frequency.
Regards,
George Kerber

Yep. The fuse is fine, I even used a magnifying glass thinking maybe
there was a break I couldn't see.

What are the possible choices of things that can be drawing too much
current? You mean other parts in the 129X or from the 'outside.'??

> I haven't owned an HQ129X for a long time, so I'm not sure, but I believe
the
> unit in the left rear corner is a 100 kHz calibrator.

Well, whatever that 'canister' is, it has a little tube or
something....actually it doesn't really look like a tube, but the tiny tip
of it is gone. Wonder if that can be causing this? Or maybe that
'canister' being loose, I'd think it wouldn't normally be like that. You'd
think anything plugged in would be somewhat firm. {?}

Thanks Don :-)

# 3176. Re: RCA AN/SRR-13 aka R-441

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-09 05:23:06 UTC
From: "Dick Carroll;" <dixie@townsqr.com>
Message-ID: <b9fdvq$724$0@208.206.142.111>
Source record: 32349

I've got two of them (SRR-13's)available if anyone is interested. One in excellent condition and the other scuffed up but complete. No manuals. Both were acquired as supposed to be working, but
I would not guarantee that as I've owned them for a few years and haven't gotten around to even plugging them into AC.

Definitely would be better if they were picked up since they are heavy. I'm Located 80 miles east of Springfield, MO.

I also have a Collins R390A (really nice), a Motorola R390A, both complete and in non-original cabinets, the Collins works, the Motorola worked a little but will need some attention, and the EAC looks like it was never ever used. Meters and PTO are out (but I have got some for it). it also needs some tubes and the PTO assembly installed. I think I have accumulated everything needed to make it go, but I'm not up to rassling the heavy iron anymore!

Anyone taking all three gets 25 new 6BA6 tubes, an original manual and some other service/restoration information and some other spares..

While I'm at it, also have an almost pristine SX28 in original cabinet (supposed to be an SX28A but I wouldn't guarantee it, tho the original manual says so), and a very nice SP600 that has front panel restored, in an aftermarket cabinet. Need to move 'em all.

Bring your truck and lots of green stamps. :-) You can email me if you want to discuss a deal, or I'll email my phone nr. I'd swap a bunch of stuff for a FT1000MP
if anyone has one to trade.

There's still a DX100 out there with 'em that has been completely professionally rewired, too.

Have an assortment of BA test gear also, signal generators, TEK scopes, (one has the HF spectrum analyzer plugin), no telling what else, if any interest. Probably 5,000 tubes of many types including some heavy duty transmit, and new and old ones.

Get 'em here before I get ambitious and load up Epay!

Too many projects, too little time and energy!

Dick W0EX

that's a heathkit filter from the indian-name receiver era. spec sheet
I have on on old 5-bander "comanche" radio calls it out as 3 MHz center
freq, down 3 KHz at -6 dB, down 10 KHz at -60 db, moderate AM filter.
4.7 K ohm load resistors on either side. possibly used in the
single-banders in the early 60s as well.

Looking in the top of the 129X, it's in the far left hand corner. Right to the left of the Voltage Regulator tube I just replaced.

The 'canister' or whatever it is also has the little mini 'tube' or whatever it is at the top of the 'can.' The tip is broke off it, just a little bit.

My Friend: To the immediate left of the VR tube there is
nothing but bare chassis metal. Slightly in front, and to the left, is the
fourth IF transformer in a rectangular can (the transformer itself is of
course concealed in the "can"). Do you have something additional ? Miki
VE7AFN.

Hi Chris, I beg to differ with you but the ART-13 and the BC-348 were and are still able to opertate on many of the ham bands in the U.S. I have worked a number of them on 75m and also 20m. By the way they also sound really Great! One of the net control stations for the Collins Collectors Association's First Wednesday AM Night Bill N6PY will sometimes use his on the net.
www.collinsradio.org for more information. I am in the process of restoring both an ART-13 and a BC-348 all I need now is the B-17 to put it in! 73

From: ljl160@aol.com
Message-ID: <20030509195328.12789.00000064@mb-m27.aol.com>
Source record: 32362

Considering selling my very nice Triton 4 setup due to too many rigs and projects. This one is very nice-good panel and letters, the scarce 242 vfo, the external digital readout, the external matching 160 meter transverter, the matching 252 power supply, manuals, the noise blanker baord and cw filter boards are already in the radio too. This will make someone a real nice classic Ten Tec station. I won't sell items separately. Have manuals. I have some jpegs. Asking $475 plus shipping. The qsk is awesome on cw ofcourse.
Thanks and 73s Lew K1NDV

Self-contained desktop HF linear amplifier capable of continuous operation at input powers in excess of 2 KW PEP/SSB and 1 KW continuous carrier with no time limit. Manually tunable from 1.8 to 29.7 MHz. Four bandswitch positions provide NO-TUNE-UP operation at full legal power on the 80-15 meter bands. High-speed QSK break-in operation. Export model has a tenth position that provides no-tune-up 10 meter operation. Operation may be broadly peaked for optimum efficiency across 28-29.7 MHz using the front panel load control. A sub-band selector switch selects optimum no-tune-up arrangement for either CW or Phone, 80-10 meters. Three Eimac 8874 ceramic, grounded-grid triodes, air-cooled. Full output power. Wired for 220V. This low-time unit is extremely clean both inside and out. The suede front panel is in the best condition I've ever seen. No wear around the dials and switches as is usually found on this model. One-owner unit. Serial #8637. Original factory manual/schematic included. This unit will be professionally foam packed in two cartons. Transformer shipped separately. 70 pounds shipping weight. Asking $1650.00. Buyer pays all actual packaging/shipping/tracking/insurance costs.

## 3200. Info Wanted on Drake AC-3, AC-4 power supplies:

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-10 14:03:25 UTC
From: yardleyite@aol.com
Message-ID: <20030510100325.05876.00000202@mb-m29.aol.com>
Source record: 32373

Greetings,
Could someone possibly give me a little advice with the AC-3 and
AC-4 Drake supplies?
1) Are they interchangable? In other words, will an AC-3 work on a TR-4, and
will a AC-4 work with a TR-3? I thought the AC-3 is peculiar to the 3/Line
since they use 12JB6 finals.
Any help will be appreciated.

Source record: 32375

Joe,

Quoting from the Drake TR-4 manual on BAMA "Its compact size makes it ideal for both fixed station use in conjunction with our model AC-3 120 volt AC Power supply, or for mobile installation using our model DC-3 12 volt DC Power Supply.

I have a TR-4 that came with the AC-3 and it works fine. If you look at the schematics for the later model AC-3 and the AC-4 there is not a nickels worth of difference in them. The older model AC-3 was the same functionally but had a choke input on the HV filter.

Finally, looking at the AC-4 Instruction manual the parts list is common for both the AC-3 and AC-4 and the manual says the AC-4 can be used for a TR-3 or TR-4 just need to set the adjustable bias correctly. That should further add confidence that they are interchangable. Manual is avialable on BAMA as well.

73, Rob, KD7HRN

If your QTH is OK on QRZ, I'll send you the info you'll need, both the "standard" pwr supply in the magazines and one that I custom built. Note that many of the conversion manuals have some bad info on pin-outs. If you don't have the old QST's and CQ's that correct the info, there's a real problem. Regards de K3HVG

>>
>I thought the single-banders used discrete crystals, though I'm not
>sure where I picked that up.

The single-banders (HW-12/22/32 and A versions)did indeed use discrete crystals, and I don't think their IF was 3 Mhz. Amazing sets - entire SSB rig on a single PC board for less than $100.

That filter is kinda unique - don't think anybody else ever used that IF. The HW-16/100/101 and SB100/101/102/110/300/301/303/310/400/401 all used 3.395.

OK, tnx much, also tnx to those who sent private email replies. All agree. So
I went thru with a deal to buy a set of xtals that will cover all the SW BC
bands in my R4A.

Bob -

I just saw a candidate on eBay -- but it is in bad shape and over $ 80
The reproduction is cheaper and a better buy at these crazy prices.

Source record: 32458

I picked up an old Heathkit SB-104 last year as a winter project but have not had the time to work on it. Now I need to clear some space in the shack and need to find a good home for it.

The rig has a few problems but does light up and doesn't smoke. However, the freq display only shows
6.603, 16.603, or 26.603 depending on the band and regardless of what you do with the tuning knob. Tuning around in the dark like that, Idid

determine that it does receive mostly okay. The audio, once you find a station, actually sounds pretty good. All the pots are scratchy of course.

>From checking the various 104 sites, it sounds like a voltage regulator

going out among other things. The wiring appears to have been done competently but definitely not a factory job. It was apparently sent back to the Heathkit repair facility in November 1977, so it should have

the updates to that point. The case will need refinishing if you want it back to pristine appearance. I don't have the microphone, manual or power cord ( I do have a new plug for making a new cord).

If you want to take on this project, you can have it for $100 plus shipping from 68504 (Lincoln, NE). I will also consider a trade for a 25+ amp 12 volt dc supply or a 5 watt 2 meter handheld with good battery

and charger.

# 3237. FS: Collins 30S-1 HF Amplifier

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-12 16:37:34 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <i5Qva.68687$4P1.6230706@newsread2.prod.itd.earthlink.net>
Source record: 32460
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. In addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits. Serial number 11590. This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 4CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965. Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer. Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight. Local pickup in Southern California (Los Angeles area) is preferred. Asking $2500.00 plus shipping.

Source record: 32461
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

This amp consists of four push-pull amplifiers (8 2SC2652 power transistors) ensuring stable 1kW output power. A built-in fully automatic antenna tuner provides instant antenna matching conditions during QSY's. Full break-in operation.

Separate RF deck and control head. For use with Icom radios only. RF deck has casters for easy movement. Control head is in perfect condition, minor scuffs and scratches on the RF deck. RF deck is floor-mounted, so this is usually not a cosmetic consideration.

Asking $3,000 plus boxing/shipping.

# 3242. Slow Warm-Up on Drake R4A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-12 19:58:55 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20030512155855.18771.00000607@mb-m18.aol.com>
Source record: 32465

My Drake R4A has to be on about five minutes before the front end starts to work. I figure it's the first oscillator, since I get background noise from the IFs (can hear the sound quality change with the selectivity and bandpass controls). Then finally it cuts in, and stays good. Performance then seems up to snuff (well, hard to judge, but it gets the 10m CW beacons).

Most obvious thing is the tube, but before I dig my boxes of tubes out of the attic (still sealed up after a big move) and hunt of that exotic tube type, I'd like to know if there's anything else that commonly fails. Maybe an increased value screen or VR dropping resistor?

The power supply seems OK -- neither the xformer nor the lytic can get warm.
Tnx es 73, Mike K. AA1UK

Hi Matt...

I just bought one from ManualMan. www.manualman.com. Took about three
weeks to arrive, but it's very nice.

Btw, I need two of the small knobs for mine. I don't suppose you might
have some extra from your stash of parts?? Or do you know of a source?

thanks a bunch!
Clay Nicolsen

# 3250. Boatanchor BFO Coil Construction?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-13 02:14:07 UTC
From: jsm <jsm@gulfislands.com>
Message-ID: <vc0l6qnmnnog7c@corp.supernews.com>
Source record: 32473

My question concerns the construction of BFO coils typically used in the 50's era. For years the James Millen company sold a "BFO Coil". Maybe you have seen one of these? BFO circuits from the Handbooks of the 40's - 50's show typical triode oscillator BFO circuits. They do not describe the circuit's coil that is always shown as a tapped coil. Hallicrafters circuits of this era also show, schematically, a tapped BFO coil in a triode oscillator. Inspecting one of these 'tapped' Hallicrafters BFO coils reveals it to actually be 2 coils, with a common ground.

So...I am wondering...are most BFO coils (such as the Millen) actually a BFO transformer, with two coils or can the BFO oscillator be made to work with a single, tapped coil?

I am struggling to repair and make the BFO coil in my S-38 functional but having little luck. If anyone has an S-38 'parts radio' with an intact BFO coil, I could become your friend for life :-)

Steve / VE7SL

# 3253. R390-A and NC-300 at Dayton booth #2964

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-13 03:28:51 UTC
From: "Jim, KK1W" <kk1w@arrl.net>
Message-ID: <3ec0675e_4@corp.newsgroups.com>
Source record: 32476

These items will be in space #2964 at Dayton on Friday and Saturday (maybe Sunday).

R390-A Receiver
Stewart-Warner #937
Appears to be all S-W modules
Original Meters
Original Top & Bottom covers
Aligned and working
Still has Ballast Tube, no mods except an 8 ohm speaker transformer installed
Good condition but not restored
All original knobs
NSA Frequency Cover (so your wife can't catch what freq. you're listening to!)
Includes connector for antenna (single pin plug)
A copy of the 21'st Century R390-A manual in a 3 ring binder
Additional printouts of mods and refurb info.
Bristol Wrench Set (no, not the original)
Partial set of spare tubes:
(2) 6AK6
(3) 6BA6
(2) 6C4
(1) 6CD6
(1) 0A2
(2) 6AK5
(7) 12AU7
(2) 26Z5W

I was going to restore this but my interests have changed. It is fully usable
(and not objectionable in appearance either) as it stands. Could be restored to
like new condition with little effort.

$500.00

National NC-300 Receiver

Good Condition
Working, but needs some TLC
Original Manual
Tech Notes
Homebrew 100 KC Calibrator
I used this with my AM station until about 2 years ago. My interests have changed

and I'm doing different stuff in the hobby.

$175.00

These will be in space #2964. We don't have power there but I will be glad to take them
where there is power if you want to see them work.

Reason for selling: I was fooling around with AM and boat anchors a few years back, now
I'm looking to buy an IC756 Pro-II. I haven't used these receivers in a few years and
figured it's best to sell them now rather than let them end up being damaged by storage.
I may have an excellent condition Johnson Viking Valiant also, not certain on that one.

Drop me an email if you'd like further information or a quick digital picture. I'm leaving
Dayton first thing Thursday morning so won't see any email after Wednesday night. If you'd
like to call me while I'm at Dayton you can reach me at 413-237-4666 anytime.

Thanks for your interest and see you in Dayton!

'73...

# 3256. Hammarlund HQ-180 questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-13 12:40:40 UTC
From: Clay Nicolsen <cnicolsen@msn.com>
Message-ID: <Xns937A4E049D194cnicolsenmsncom@216.166.71.230>
Source record: 32479

Hi guys...

I recently acquired an absolutely gorgeous HQ-180C with the rare noise blanker option (second purple knob on the noise limiter pot & a total of 21 tubes). It's the cleanest 180 I have ever seen. Front panel, cabinet paint, everything is flawless. After completing the cleanup and tube check (all tested 90-100+!) I have two follow-up questions:

1. The S-meter sticks at the low end of the range. Not a rare problem, I know, but any suggestions? Works perfectly from about S-5 up. My knuckle is getting sore from tapping it!

2. The audio performance is a bit of a disappointment. Very muddy & garbled, not nearly as crisp & listenable as my HQ-145X, or even my National NC-121. I find myself cranking the RF gain way down to clean it up. Leaving the noise limiter/blanker off helps quite a bit, I know the NB can cause audio distortion. Considering that this appears to be a very low-hours radio with good tubes, I'm hoping not to be looking at an alignment. I'm not that experienced with using a signal generator to do a full alignment, and this is obviously not a radio to practice on. Any suggestions?

Thanks a bunch!
Clay

My 2c worth. If you are listening to AM the HQ-180 can indeed sound a
bit muddy since the selectivity is so narrow...I think it is +/- 3 kcs,
considerably sharper than 'lesser' receivers.
Definitely leave the NL off unless it is specifically needed and
accomplishing something. I've never used one with an NL but I suspect
that would be true also.
Make sure the notch is accurately aligned so that its not inadvertently
chopping into the signal when turned all the way to an extreme.
I seem to recall you could play with the vernier tuning...tune off to
one side and retune the main tuning to shift the audio into the bandpass
so that you have full use of the available bandwidth on one side of an
AM signal.
In any event, its a communications receiver and not really optimal for
e-z listening AM broadcast reception. When you try to select a
split-channel AM broadcast frequency you'll see its advantage or go with
SSB/CW/TTY and it'll kick butt over the 145 or the National.

Clay,

Just to amplify (no pun intended) on Bill's comment, page 18 of the
HQ-180 manual from the BAMA website says:
"Whenever the receiver is being tuned for normal reception be sure to
first rotate the Slot Frequency control to either minus 5kc or plus 5kc
for normal tuning or the center of the passband will be slotted out."

If you haven't got the manual, it can be downloaded from
http://bama.sbc.edu/

Steve,

Yes, a BFO certainly can work with a tapped coil; oscillation is just a
matter of the tank circuit L and C and the feedback to the tube.
Electrically, a tapped coil is just a variation of the transformer you
saw with two physically separate coils.

Clay --

Hammarlund was at the top of its game with the 180's.
I have owned and used them since the late 1960's when
I obtained my first one, a 180C. Today, I still have that
one, as well as a 180AX and a pristine 180AC I obtained
over the years. Yes, the noise limiter adds unwanted
distortion so use it sparingly. Do not, repeat do not, ever
use regular TV tuner-type cleaner on the RF plates or
you will find the receiver being thrown out of alignment.
Can't help you on the S meter as all of mine have been
fine.

Regarding the busted BFO coil. It should be possible to rearrange the circuit slightly so that the tap on the coil is not required. An alternate configuration of the basic Hartley oscillator is where the resonating capacitor is split into two sections, with the junction going to the cathode. An RF choke is required from the cathode to B- to complete the DC path. You can futz with the capacitors to obtain the desired degree of feedback. Usually, about 8:1 with the 1 being on the high side, is a good starting point.

Well, that's a very good thought. ISTR the S-meter reads near zero till the
set perks up (unless you turn down the RF gain, in which case I think the S
meter goes up, as on most RX when they're working at all).

But I will check the meter behavior and get back to you! Tnx, Mike K.

This AM I opened her up and jiggled the tubes. Found several were intermittent in their sockets, including both 50 KC IF amps. Treating each tube's pins with DeoxIt seems to have given steady operation. Now it's a pretty hot performer.

Sounds great on AM at the 4.8 KC BW setting, a claim that many SSB-era BAs can't make. Eagerly awaiting the extra xtals that will put it on the SW BC bands.

On *really* strong signals the AM overloads a bit -- might be the noise blanker.

I oiled the preselector pulleys and PBT cam, and now I just have to dig out a 12BZ6 for the RF amp. That tube was lit up bright yellow like a 201A in an old wooden radio, and hotter than a 6CL6 driver. Sure enough, someone had slipped a 6BZ6 into the socket, without rewiring the filament supply. It's amazing how long that tube has held together, but it's kind of gray all over the inside of the glass, like an old pilot light bulb. Probably wouldn't do much now on 6 VAC.

The power xfrmer does get warm after a while, and I'm hoping the correct tube will shave some load off its filament winding. Tnx to all who offered advice -- Mike K.

Hi all, Available at Dayton spaces 1943-1944:

For Sale:

Harvey Wells station including:

R-9A receiver works but has had some mods cosmetically done to it

T-90 transmitters (two of them) - not tested

APS-90 power supply - not tested

Bandmaster Z MATCH - not tested

FS-1 Fixed station speaker works good

No connecting cable for power supply but I do have the Cinch Jones
connectors

Original manuals for the R-9A & T-90 reprints for the other pieces

At Dayton flea market spaces 1943-1944

Equipment in fair to good or better condition not beat up or filthy.

Manual reprints available on all pieces also.

73 de Larry WA9VRH

Sounds like you have 'er going. If you replace the tube(s) in the front end of that receiver, and the receiver loses some sensitivity, you may have to realign the front end. It's a simple procedure that is in the owner's manual..I had several R-4B's over the years (along with the transmitter) and I sure miss that setup. It was much easier to listen to then my Yaesu FT-901DM that I now own....

# 3275. Hammarlund HQ-180 questions...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-14 01:57:46 UTC
From: Clay Nicolsen <cnicolsen@msn.com>
Message-ID: <Xns937AD50629993cnicolsenmsncom@216.166.71.230>
Source record: 32298

Hi All!!

Thank you so much for your input. I'm starting a new post because my reader (Xnews) somehow is no longer displaying posts that I've read, even though I do not have "show unread articles only" checked, and I can no longer read your replies.

Thanks to Harold, W4PQW, Bruce, AB7YD, and Al, K4ICL for your email replies, and thanks to those who posted replies in the group. I apologize for not thanking you by name, but I can no longer see your posts.

It was the slot/notch filter setting! Aaaaaaarggggghhhhh!

Thanks for pointing out to me not to have the Slot Freq setting pointing straight up to "zero". Come on, cut me some slack...it looked so much neater with both pointers lined up! Thanks for the follow up post to that one mentioning that the manual clearly stated (Manual?? manual?? I bin doin' this fer 40 years...I don't need to read no stinkin' manual!!!) that the Slot Freq setting should be set to + or - 5 kcs, not to zero, for normal listening.

Just to make it crystal clear what kind of a numb nuts you're dealing with here, while I've been familiarizing myself with this receiver I had noticed the following two interesting things:

1. While tuning through strong, clear signals I was really puzzled that I wasn't seeing a classic "bell-shaped curve" for the signal shape...starting from one side of the skirt the signal obviously should gradually get stronger and clearer, finally peak, and then fade away on the other side. Instead, on every clear signal, I noticed a distinct "U" shape to each signal. The signal would get somewhat stronger, but not really good, ya know?, and then suddenly completely drop out in the center, almost like I was tuning through some kind of a..a...slot, or...or...whaddaya callit...a...a...a notch!...yeah, yeah, that's it...a notch! Then it would come back, again a bit muddy and garbled, and then finally fade away again.

2. While testing the function of each of the controls, I had noticed that when I turned the Slot Freq control away from the center zero point, the muddy, garbled audio suddenly became much clearer. Since that obviously couldn't be the way it's 'sposed to be, there must be something wrong with the radio!!

Stooooopidstooooopidstoooopid!!!!

Being in the technology business, I'm reminded of a famous story:

A guy was having trouble with his computer, and asked a friend and expert for some help. The friend sat down, took a look, and with a few keystrokes and mouse clicks fixed the problem. The guy said "Gosh, that was easy, what was it?" His friend said "It was a classic "ID Ten T" problem". "ID Ten T"?? I don't get it. The friend grinned and said: "Write it out, you'll see!"

ID10T!!

The receiver is awesome! Even with the max 3 KHz selectivity, it still sounds terrific. I've got the correct S-200 speaker, and it's just wonderful.

Obviously, given the number of posts to this group, I'm not the only one with tube disease. It brings me back to the magic I felt when I was a kid. Somehow, it's just not the same with new gear. I've got a Kenwood R-5000 sitting next to my boatanchors on my desk. Once I've found what I want to listen to, I use the Kenwood to verify the frequency I'm tuned to, and then it's back the the Hammarlund, (or the National, or whatever I'm using tonight).

I'm in the middle of a restoration of a National NC-46, with the matching speaker. What a great performer for a 1940's single conversion radio! I love the "art deco" look.

Thanks again for the help! Now that I'm sure that the 180 is a keeper, I might be selling the 145X to make room for something new!

This group is terrific! I love you guys!

Clay

# 3276. Needed: Knobs for National NC-121

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-14 02:10:50 UTC
From: Clay Nicolsen <cnicolsen@msn.com>
Message-ID: <Xns937AD75DE1D7Dcnicolsenmsncom@216.166.71.230>
Source record: 32299

Hi guys...

Bought a non-working National NC-121, and after a little sweat and solder, I've got it running great. All I need now is two of the small knobs. Can anyone help me out? If you don't have 'em in your junk box, maybe you know of a source? If you've got a parts radio, I'd be interested in that.

thanks in advance!
Clay

Hi there,

I need a copy of the manual for the REH WWII vintage morale receiver.
Has a number CDL-46271 on it.
Costs reimbursed.

>FT-901DM that I now own....

Yeah, I love the audio of the R4A on the widest BW setting. Though it does distort on REALLY strong signals, like 40m SW BC powerhouses after dark, and the RF gain control doesn't really turn the gain down all that much.

There is still some threshold or squelch-like effect on AM, whereby sigs have to get over a (small) level to "crack" the AM detector. It's a weird circuit with a diode plus a transistor, might have a slight problem.

And there is still a slight, maybe two minutes, delay before the radio starts to crack the threshold. During this long warmup, the xtal calibrator is off by 25 KC, which leads me to think the whole RX is off by that, and maybe part of the injection system isn't working. Oh well, have to dig out the tubes in the attic anyway for a 12BZ6.

I found my manual copy, and it proudly claims you can replace tubes without re-aligning, but I like to align, have the test gear and the manual, and this rig looks pretty old, so might as well see how much I can squeak out of it.

The notch and PBT are already pretty well centered, so maybe (?) the previous owner did some alignment. Someone in the past added a couple lytics under the chassis, presumably in place of the chassis-mounted can which is still there, but I can't see if it's still wired. Better check that real soon ... 73, Mike K. AA1UK

From: Roger Basford <Basford@btinternet.com>
Message-ID: <OMrdrmAMegw+EwA+@btinternet.com>
Source record: 32309

Hi,

Have a Heath TC-2 tube checker and am looking for the 6AM6 settings as they are not listed on either the chart roll or the updates/cross-reference list I've acquired from BAMA. The 6AM6 is the EF91 in the UK and also the Z77 and 6064 but none of these show up either. I know it's not a common bottle in the US but plentiful over here. Any help appreciated!

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 18th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Source record: 32311

I am selling my nice Triton 4 station due to too many rigs and projects. My Triton 4 is very clean with excellent front panel and letters. It has the noise blanker and cw filter boards in it already. I have the matching (scarce) 242 external vfo, matching 252 power supply, both the matching external digital readout and 160 meter converter. Have manuals or manual copies. This setup is still great on cw qsk as most Ten Tecs. I want $475.00 plus a little shipping. I do not want to part out the station. It will make someone a nice classic operating station. Thanks for the read and 73s Lew K1NDV tel: w and h 617-527-2097 I'll return msgs

Hi...
I picked up two twin Ampex H-1390's in almost new condition. Can anyone
tell me anything baout them. Are they high impedence mics?..For transmitters
etc..Any info would be appreciated..Thanks...

# 3298. FS: Hallicrafters R-42 Speaker - Very Good Condition $100 plus shipping from 60516

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-14 22:55:34 UTC
From: John Vercellino <jvercellino@sprynet.com>
Message-ID: <GPzwa.839152$3D1.480119@sccrnsc01>
Source record: 32320

Up for sale is a Hallicrafters R-42 Reproducer Bass Reflex Speaker. This speaker was designed to match the SX-42 receiver with its beautiful push-pull audio section. But this vintage boatanchor speaker will do wonders for your other Hallicrafters, Knight-Kit, Heathkit, National, or Collins receiver or transceiver!

It uses an 8" permanent magnet speaker with a 500 ohm impedance in a steel tabletop bass-reflex cabinet. You can use a transformer to match the impedance of radios that have different output impedances. I'll even throw one in as part of the deal.
The interior of the cabinet is coated with a felt-like fabric to eliminate cabinet vibrations. It has a built-in switchable crossover network for communications or hi-fi reception. The speaker was produced from 1946 through 1948. It is in very good condition. No dents or dings, but there are some scratches due to normal wear-and-tear.

It's a bit heavy, so I will carefully pack it to prevent accidents from happening. However, if you prefer, I can have the speaker professionally packed for you, at cost. Get it now before Dayton - $100 plus shipping from 60516.

73, John WB9OVV

Ampex rebadged a lot of Altec and EV microphones under their name, for sale with their consumer tape recorder line. Check the old Altec and EV catalogues and see what they look like.

Most of the stuff they sold were high-Z cheapies although they resold some of the dual-impedance EV mikes and the like.

FWIW Brian / Clay, I was once told by someone 'in the knows' the same thing
you said Brian. I know on both of my Hammarlund's, I can have the AVC all
the way up also. My 1 cent ;-)

I'm thinning my collection and will have several nice Boatanchors for sale at Dayton, inlcuding:

RCA AR-88LF
Hallicrafters S-38B & S-38C
Signal Corps BC-1306
Heathkit DX-40
Signal Corp BC-342
National NC-46 & Speaker
Galaxy V & Speaker/PS

and much more I've forgotten.

See you Friday and Saturday at 1946 & 1947.

TNX es 73,

Tony

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. IN addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits. Serial number 11590. This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 4CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965. Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer. Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight. Local pickup in Southern California (Los Angeles area) is preferred.

Asking $2500.00 plus shipping.

Yaesu FV101B External VFO

The FV101 External VFO has been designed to provide versatile operation with the Yaesu FT 101 transceiver.

This unit eliminates the need for a separate receiver or transmitter in order to operate cross-band. For the contest operator, DX chaser, or Net Control Manager, the FV101B becomes an indispensable adjunct to the station.

Asking $125.00 plus shipping/boxing/insurance.

# 3313. Rewire Drake RX for 6BZ6 instead of 12BZ6?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-16 03:14:24 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20030515231424.00486.00000025@mb-m25.aol.com>
Source record: 32337

Isn't it a good idea to rewire a Drake R4x receiver to use a 6BZ6 RF stage tube instead of the original 12BZ6? I must have 3 or 4 used 6BZ6s and 3 more brand new in boxes, but nowhere in my tube colleciton is a 12BZ6. Maybe I could order one from ARS, but that's just delaying the problem or passing it on to the next user, who will be stuck someday looking for a rare 12BZ6.

The filament transformer, at least in my R4A, is 12.6 VAC center tapped. Some tubes, including that RF amp, are between the two hot legs for the full 12.6VAC, but others are connected between one hot side or the other and ground. So at least on the schematic it shouldn't be hard to shift one side of the xBZ6 heater to ground.

I can think of some reasons not to do it:
(1) Unbalance the load on the filamnet winding (is this worth worrying about?)

(2) Maybe the extra current and unbalanced heater feed will induce 60 Hz hum? Is this likely in an RF stage?

(3) COnfusion to the next owner, who plugs in a 12BZ6 (found in an Iraqi musem?) and gets nothing?

(4) Desecration of a sacred BA -- I know that Drake is essentially Collins at 1/4 the price and 1/2 the religion, but that's still a lot of religion :-)

(5) The thought that Drake's engineers might have had some reason for using a 12-volt version of the tube. Probably they got a good deal on a warehouse full of 12BZ6s when the maker realized that no cheap AC/DC set would ever use that good an RF amp tube.

Any thoughts? Tnx es 73, Mike K. AA1UK

Source record: 32341

I have a Hammarlund HQ 120 which has had a modification to the tube line-up. The second tube from the front panel on the right side of the tunning capacitor assembly has been changed to a 6U8. The previous owner made the change and also informed me that the receiver never worked after the change! does anyone have any information about this modification? I assume it was suggested in some magazine article in the distant past.
Thanks

# 3319. Military sets FS & FT

Military sets FS & FT

Exchange:

PRM-4031 hf multimode manpack radio, cw,ssb,am, 10w, 12v, 1.6 to 30 MHz. ( no handset, battery or whip )

WS NO 128, Special Forces set, receiver unit, 2 to 8 MHz, rx tunable. Good condx, with circuits, info etc.

both offered for exchange ? something in a similar line maybe.

For Sale;

German WWII E10K receiver, good condx, with valves ..... £160

Transmitter SR, 5 channel VHF set, in very good condx, rare item..... £30

CPRC-26, handset, whip, webbing bag, earth lead, instruction plate, good condx, £35

WWII, Test set, Type 74 used to align IFF etc and used in Jamming. 240v ac, working, fair condition front panel, very clean inside. £25

Wireless Set No 17. Very nice example, with headphones and mic, good condx, clean inside, as used between Searchlight Batteries and HQ £70

Dynamorors: DA-3A 28v in 300/150/14 out £15 DM-37-D 24 in 625 @ 225mA out £15

200 W Power meter, dummy load, with o/p for scope and VVM ..... £25

all plus pp. Ben G4BXD

IMHO change anything you want, it IS your radio after all. Remember to
mark your manual and also mark the chassis of your change. I do not
think that Drake is a half priced Collins, I have always thought that
Collins was over rated with an inflated price. Expect some flak for
desicrating an old receiver. I have never subscribed to the theory
that we need to worry about future owners of our radios and have
changed many things to suit myself ( just can't bring myself to punch
an extra hole in the front panel though )

Have a great day and good luck with your mods.

73

If the R-4's 12BZ6 tube has both its cathode and suppressor grid
grounded, you can substitute a 12BA6 tube.
(A super cheap substitution, and no rewiring.)

The 12BZ6 has cathode on pin 2, and supressor on pin 7;
the 12BA6 has cathode on pin 7, supressor on pin 2,
otherwise both tubes have the same pin-outs.

73,
Ed

Source record: 32246

Might work, but I wouldn't count on it.
Just because two tubes have the same, or similar basing doesn't mean
that they are interchangable.

The 12BA6 is a remote cutoff pentode, the 12BZ6 is a semiremote cutoff
pentode. Their curves are quite different. If the 12BZ6 is involved in
the AGC circuit, replacing it with a 12BA6 will make a complete mess
of things. The receiver won't have the correct sensitivity for a given
AGC voltage. This will result in diminished performance.

If you take a quick look at the specs, you will see that a 12BZ6 has
about twice the transconductance of a 12BA6, 8000 vs 4300. So even
at its best, the 12BA6 will lower the sensitivity of the radio.

The interelectrode capacitances between the two tubes are quite
different. So, at a minimum, the set will need to be realigned.
And there is a possibility that the set won't have as good sensitivity
in the upper bands.

There is a real reason why there are so many different flavors of
tubes all with the same basing.

Go out and hunt for a 12BZ6. It took less than 5 minutes to find
4 different suppliers with prices that range from $4.50 to $12.00
all NOS.

Date: 2003-05-16 16:01:11 UTC
From: Craig Cool <cool1986@earthlink.net>
Message-ID: <bX7xa.815$lo.64107@newsread2.prod.itd.earthlink.net>
Source record: 32247

This device will iron out those fading SW signals.
Brookline Technologies VS301E Volume Stabilizer featuring adjustable stabilization from 10:1 to 1:1, bypass switch, 3 colored LEDs. $50 plus shipping via USPS Priority Mail. I'm located in Plano, Texas.

This item may be viewed at the following web site...scroll about 2/3 down the page for an excellent photo. Of course you may want to read the review also that compares Brookline Technologies to Sima.

http://members.fortunecity.com/swradios/svs1.html

Much credit to Dave N9EWO for the review and photo

If interested or questions email cool1986@earthlink.net

## 3325. fs/ft Kenwood TS-820s and AT-180 tuner

Newsgroup: rec.radio.amateur.boatanchors

not exactly heavy metal, but is a great older rig.....

I have for sale or trade a nice looking and working Kenwood TS-820s transciever 160-10 mtr and a little over 100watts output, and a Kenwood AT-180 Antenna Tuner, looking for higher power 2 mtr and HF amps, and just other ham related "stuff", i have high resolution digital pictures of the set on request.

thanks!

knudsenmj@aol.com.Oscar (Mike Knudsen) writes:

>Isn't it a good idea to rewire a Drake R4x receiver to use a 6BZ6 RF stage
>tube instead of the original 12BZ6?

Based on the advice I got from the Net (go ahead and modify the RX, but don't substitute a non-BZ6 tube), I went ahead and rewired the filament to the 12BE6.

I was pretty easy to do, since Drake kindly staged the heater feed for the lone RF tube from a tie strip. I just removed the 12.6NAC line and ran a jumper to the nearby V2 (6HS6)'s 6.3VAC tie point.

The radio now plays all evening, without suffering the grid emission problems that hosed the AVC in the over-heated 6BE6. But, I gotta tell ya, that overfired bottle sure packed a lot more gain. While it lasted, I could peak S5 on 28.5 MC from the xtal calibrator. With the brand new 6BE6 on its proper heater voltage, I can barely nudge the S meter on 21 MC. Yes, I re-aligned the front end.

The set still takes a few minutes to start playing -- I think one of the local oscillators could use a new tube. ISTR seeing some 6HS6s in my collection, and other types used. 73 es tnx for the advice -- Mike K. AA1UK

news:<ba3s3h$1fp$1@slb6.atl.mindspring.net>...
> Trying to find the value of black capacitors with color code stripes
> starting with.... brown-blue-yellow-blue---red.
==========
Gil:

Are you sure about those colors? The "black" bands on those caps
often look somewhat blue. I suspect your colors are:
brown-black-yellow-black---red.
In that case you have a 0.1uF, 400 volt, 20% capacitor. The
brown-black-yellow translates to 100,000pF which is 0.1uF. The next
band (black) is 20% (white is 10%) and the last band spaced out from
the others is the voltage rating with yellow indicating 400 volts (red
is 200 volts and blue is 600 volts).

So, looking at the first three bands on these things, a
yellow-violet-orange is a 0.047uF, a red-red-orange is 0.022uF,
brown-black-orange is 0.01uF, orange-orange-red is 0.0033uF, etc.
They read exact like resistors except the values are in picofarads
instead of ohms.

Hope that helps,

Ed
Canyon Lake, TX

Oops, I kept typing 6BE6 instead of 6BZ6, which it rhymes with. Anyway of
course I meant 6BZ6.

BTW, a 12BA6 doesn't really sub for a 12BZ6, since the cathode and suppressor
grid pins are reversed. The R4A has the suppressor hard grounded, while the
cathode has a series resistor. A 12BA6 would not get the proper bias.

# 3347. Swan 250C wipes out Yaesu 212 RH ...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-18 03:15:10 UTC
From: Jos <josuha1954@yahoo.com>
Message-ID: <vce1u0tm6ip524@corp.supernews.com>
Source record: 32271

I just got a Swan 250C on the air..When I keyed it the 2 meter Yaesu 212RH
'blinked" on and off three or four times..
The 212RH is hooked to a power supply.
The Swan sounds goo..but the 212 RH 2 meter now does not key to transmit.
All other functions are ok..
Any ideas?

Thanks..Josh

COLOR CODES FOR CAPACITORS

Although the capacitance value may be printed on the body of a capacitor, it
may also be indicated by a color code. The color code used to represent
capacitance values is similar to that used to represent resistance values.
The color codes currently in use are the Joint Army-Navy (JAN) code and the
Radio Manufacturers' Association (RMA) code.

For each of these codes, colored dots or bands are used to indicate the
value of the capacitor. A mica capacitor, it should be noted, may be marked
with either three dots or six dots. Both the three- and the six-dot codes
are similar, but the six-dot code contains more information about electrical
ratings of the capacitor, such as working voltage and temperature
coefficient.

Hello everyone,

Sorry for the off-topic post, but I braved the weather at Dayton Saturday
and
picked up a Millivac MV-823A-1 RF millivoltmeter. I was wondering if
anyone might have a manual for it that they no longer need, or if someone
might know of a source for one. It was completely soaked, but after a good
drying out it seems to work. Thanks,

Kevin, K9HX

## 3354. SB series parts needed

Hi All,

Buyer backed out of a deal for a 401/303 pair, so I've decided to give them a whirl. Need the following:

CW and AM filters for the 303
Xtal pack for the 401
6-8 ft of the RG-62 for the interconnect cables
2 prong line cord for the 401
125uf 450V caps (2)

have some old QST's, a NC-300 speaker and possibly other stuff to trade or will buy outright.

tnx es 73

From: Chris Bowne <radiobwn@riconnect.com>
Message-ID: <vcf9hekv203rde@corp.supernews.com>
Source record: 32279

Ed's Zeranski's Boatanchors newsgroup query on the TCK prompted this post on my long neglected project to get my TCM on the air. What has held me up is figuring out how to provide power to the various stages, which in the original design, depended on various voltage dropping resistors and bias returns installed in the external power supply. Anyone on the list ever power one of these up with a non-stock power supply system? How about running an external plate modulator? Mine came supplied with an excellent looking rack mounted homebrew modulator, using a pair of 811s and a CVM-3 mod transformer, driven by 2A3s.

# 3360. Free for postage: Three metal tubes,5T4, 6SR7, 6J5

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-18 20:19:19 UTC
From: John Vercellino <jvercellino@sprynet.com>
Message-ID: <bVRxa.370447$Si4.313953@rwcrnsc51.ops.asp.att.net>
Source record: 32283

Free for postage: Three metal tubes,5T4, 6SR7, 6J5. All these tubes are USED.

6J5 - Metal tube used in detector, amplifier, or oscillator service in radio equipment. High transconductance and amplification factor. Tested GOOD.

5T4 - Metal type used in power supply of radio equipment having large dc requirements. Requires octal socket. Vertical tube mounting is preferred but horizontal mounting is permisible if pins 2 and 8 are in vertical plane. Tested OK.

6SR7 - Metal type used as combined detector, amplifier and avc tube in radio receivers. It is equivalent in performance to type 6BF6. Requires octal socket and may be mounted in any position. Tested BAD.

These tubes are free for postage from 60516. I will ship them to you by either parcel post or first class from ZIP 60516, whatever is cheaper.

# 3363. FS: Racal 100W HF Linear Amp

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-19 07:28:56 UTC
From: Nico van Dongen <nico.vandongen@compaq.com>
Message-ID: <YI%xa.1001$pg7.519@news.cpqcorp.net>
Source record: 32286
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I have a RACAL TA940-B 100 Watt Linear Amplifier. This amplifier was designed for use with the TRA 906/921/931 Squad- and Syncal HF manpack sets but is usable with other HF sets as well.

Specifications:

Frequency range 1.6 - 30 Mhz

Input: 1 to 5 watt (adjustable) or 0.1 watt fixed p.e.p. into 50 ohms unbalanced (jumper selectable)

Output: s.s.b. 100 watt p.e.p. nominal

d.s.b. 25 watt carrier approx.

f.s.k. 100 watt mean nominal

c.w. 100 watt nominal

output impedance 50 ohms unbalanced

power supply: 28 volts DC 11 amps. The amplifier may be used over the range 24 -30 volts with degraded performance at the lower voltage

dimensions: width 359 mm (14,1 inch), hight 167 mm (6.6 inch), depth 225 mm (8.9 inch)

weight 8.9 kg (19.5 Lb)

The amplifier comes with a copy of the manual and a DC power input cable and is in very good condition

Price 300 US$, shipping cost to a destination outside Europe will be 70 US$

Nico PA3ESA

Bill I did that mod to mine -

- works pretty good but you will have to buy an 19.545 Mhz (20M) XTAL to replace the 26.545 (15M) one. I bought mine from International Crystal (1-800-725-1426) for $19.95. Ask for HC-17U holder with 16 pF.

Also peak up the receiver sensitivity by replacing R42 (5.6K) with 51K 2W and R21 (22K) with 10K 2W resistors.

If your using an HG-10 VFO - you can expand the CW VFO tuning range by removing one blade (stator) from the C1 variable cap. Be sure you have C1 as C1 and C2 share the same shaft. You will have to retune C6 and C7 so the start of the band matches the dial drum. The other freqs won't match so carefully scratch them off with a screw driver.

This is a few of the mods I did.

Works great! CU on 20 meters...

For the moment I've got it going with a surplus 9.67222 xtal operating
at the overtone. Am awaiting the scans from the previous gentleman to
see where to tap the output network and to get any other specifics for
best performance as opposed to simply 'working'.
>
> Also peak up the receiver sensitivity by replacing R42 (5.6K) with 51K 2W

Yep, did those.

One other question. I did the sidetone volume mod but is there an easy
way to partially mute the receiver when operating on frequency?

Tnx,
Bill

# 3373. Noisy Gas Generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-19 18:47:12 UTC
From: Keith Densmore <densmore@idirect.com>
Message-ID: <vci9kqdbbdv2c7@corp.supernews.com>
Source record: 32196

Greetings,
Here's one I've never seen addressed before. I purchased a 4kw gas generator to power a few boatanchors at the cabin. I've had no problem dealing with the RF noise but the engine and muffler noise is loud--most annoying. This particular machine uses a 8 hp Briggs and Scranton engine with stock muffler.
Anyone had any experience quieting these beasts down? Suggestions?

Thanks,
Keith, ve3gem

Try varsol. MFP is a varnish. Varsol won't touch most
plastics. But since it is so gentle, it may take it a while
to soften the MFP.

If that doesn't work, one of the citrus based paint strippers.
Something that is environmentally friendly. Something without
Methylene Chloride, or MEK.

Plastics are funny, it is hard to tell what will bother them,
and what won't.

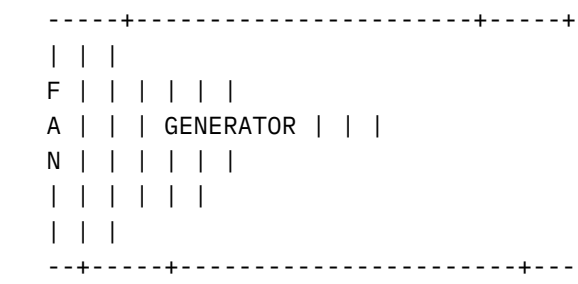
The problem with quieting down a B&S motor is they were never
meant to be quiet. The quiet generators spin at 1800 rpm, the
B&S spins at 3600 rpm. Even if you eliminate the exhaust noise,
the clanking of the valves, and other engine parts will annoy
you.

That leaves you with putting the whole generator in a well ventilated
muffled box. A box with lots of sound deadening material on the
sides. You will need an extra fan to move the air thru the box, and
you will need baffles to absorb the noise that wants to come thru the
ventilation openings.



-Chuck

Not really, and I have tried all the usual tricks like hay bale walls and
fancy mufflers. So much of the noise comes out of the engine itself.

The best solution is to buy one of the Honda generators which are designed
for low noise. Lots more money, but worth every penny. You can rent one
for Field Day if needed.

# 3378. ISO Azden Mike Info & Wilson Rotor Connector

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-19 20:47:47 UTC
From: Don Smith <desmith@innercite.com>
Message-ID: <vcigr4l7pll7ad@corp.supernews.com>
Source record: 32201
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,alt.radio.amateur

Greetings all I am in need of Microphone information on a Azden PRS-400. I just acquired a unit and it was without a microphone. If anybody out there has a microphone that will serve and/or a schematic or manual I would be grateful. Gladly pay any costs incurred.

I am also trying to locate a connector for the Wilson WRY-500 Antenna Rotor. I need the outside 8-Pin female connector that looks like a Cannon connector. If anybody has one that will work or could point me to a source, that too would make me grateful. Please respond to my email address. Thanks Don Smith KB6GQA

# 3379. ISO Couple of MT-8860 and MT-8865 IC's

Newsgroup: rec.radio.amateur.boatanchors

I am searching for a couple of the DTMF IC's used in a Comm Spec Repeater Controller. They are Mitel MT-8860 and MT-8865. Could use a couple of each or any other replacement IC's that would work. Please respond to my email account. Thanks Don Smith KB6GQA

Basically, you can't mix and match those things. You're stuck basically trying to find someone who has kept the exact model microphone with the exact frequency (unless you want to recrystal). I see receivers at hamfests all the time but nobody ever remembers what happened to the microphones.

Because they use companding, you can't just use a Shure mike on an Azden receiver and expect it to work decently.

Is it a Cannon P-connector style thing? If so, Connector World Supply in Seattle will have it.

WHAT a Bunch of wimps! I was much wetter in the shower in the morning and got to se a couple of hundred people that I have met there and at other hamfests that I probably get to see once a year! Just because the weather isn't perfect and you get your shoes wet you have to look at the big picture. I went with four friends that had a great time because of the Hamvention! The off hours let us get caught up on the last year or more. Quit your whining and enjoy the whole event or just stay home! The rest of us will be their enjoying our friends from all parts of the earth! 73 Larry WA9VRH

>>
That xtal will work but the dial won't read right. 14.0 will be at "200".
The 19.545 Mhz (20M) fundamental XTAL was the one recommended in the
article. 14.0 will read as "0" using it. A 2nd harmonica will work only it
won't be producing as much power going to the mixer so 20M signals will be
slightly weaker.

You will need to add 100 pf to L1 (to peak the rx sig from the RF amp). A
Disc is fine for that. Mica is better if you got one. Adj slug for max rx
sig.

Output Network: You will have to remove it from the chassis to get to it.
Tap L12 11 turns up from bottom. Between 40m and 15m taps.

Lastly solder a 20 pF mica across the terminals of L9 in the IPA Output
Circuit and peak for max transmit RF into the 6GE6 PA.

Partially mute the RX?

I have not found one. I like the feedback as I know where the XTAL is on my
RX dial. Is yours too strong?

Right. I'm just using it to see how things go before I make the
"investment".

Yes, I like the feedback too but it is WAY too loud. I only use phones
and I bet a speaker would drive my neighbors nuts! I guess there's any
number of easy ways to kill the rcvr but at the expense of the break-in
keying. I figure somebody has been down this path before.

>Are there any surplus stores there?

Not that I know of any more. There used to be a wonderful telephone surplus place on Broad Street, and also the local telephone company had a reclamation facility nearby, but those are now both long gone.

However, there is some very impressive stuff at the state surplus auctions, and also the DRMO defense surplus at Cheatham Annex is less than an hour's drive away.

GOOD:

Nice looking RX.
SSB and AM sound decent. But not super great - just ok.
Good freq stability - no microphonics
Can read heavy solid dial to the nearest kilocycle.
Covers 80 - 40 - 20 meter ham bands

BAD:

Tends to overload on stronger sigs - unless you "de-tune" preselector.
"S" meter pretty scotch
No AM Broadcast coverage (550 - 1700)
Has 27 Mega"Hurtz" CB band coverage - yeeeech!
No CW filters.
Misses the newer SWBC freqs - (i.e. Tunes from 9.5 to 10 - missing smaller
domestic SW stations in 9.4 to 9.5 band.)

Bad - these receivers are 30 years old. Electrolytic cap is probably dried
out and will cause a hum... but that's GOOD - cause it's a simple fix and
you might knock the price down a few bucks.

Overall impression = so - so
There are much better receivers for the same price.

I would much rather have either a Hammarlund HQ-100 (tube) or a Kenwood
R-600 (solid state) short wave receiver...

OK Bill let's try this... have not done yet but it should work. (I think)

Both V4 (IF) and V1 (RF) have cathodes tied together and go to RF gain control. V4 and V1 cathodes have 28 VDC on TX - 0 on RX

This is tied on one side of the RF Gain pot (R48-200) to R47 (22K) and the other side to Emitter on Q1.

Q1 Emitter has 27 VDC on TX and 0 on RX

Q1 Base has 30V DC on TX - 0 on RX.

Q1 Collector is tied to ground.

Would it stand to reason if we can increase the voltage to the cathodes of V1/V4 it should reduce the audio feedback level on transmit ??

Seems this could be done if we reduce the value of R47 to 20K or replace it altogether with a 50K Pot and make feedback adj.

Make sense?

Let me print this out and peruse it.

Just finished getting the mods done and it kicks butt and sounds good on
20m. Gotta let some of the Deoxit dry off, or wash it off the bandswitch
with alcohol, before actually seriously operating :-)
(The pump spray De-oxit (DP5) is not my friend...aerosol for me!)

Makes sense but maybe I'm trying to fix the wrong problem. I need to
first check and make sure I'm actually getting the designed cut-off bias
of 27vdc. I don't really think a higher voltage is going to cut them
off significantly more than they would be already.
Of course part of the issue is that I still don't have the 20m receive
peaked up to the max since I'm lacking the correct xtal and consequently
the volume is turned way up as compared to 40/80...even tho its still a
issue on those bands as well with the volume down.
I'll keep this idea in the fire once I settle in and get the basics out
of the way.

Tnx,
Bill

# 3397. Collins S-Line Analog Meter Repair

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-20 01:41:03 UTC
From: "G.Beat" <abuse@comcast.com>
Message-ID: <PIfya.902439$3D1.515238@sccrnsc01>
Source record: 32221

Bartlett Instrument Company, Fort Madison, Iowa was the
original equipment supplier to Collins Radio Company for panel meters for
S-Line equipment. They have traditionally repaired damaged Collins S-Line
meters
for Collins restorers.

Bartlett Instrument Company
14th Street and Avenue M
Fort Madison, IA 52627
(319) 372-8366 FAX (319) 372-5560

I talked to Rob today at Bartlett Instrument Company.

Bartlett is no longer performing repair work on analog meters.
The woman who specialized in the analog repair work took ill about 3 years
ago and has since retired. Bartlett refers their analog work repair work to
Hoyt Electrical Instruments Works (NH), one of the largest manufacturers of
meters and custom meter movements. http://www.hoytmeter.com/

The Collins 30L-1 meter, that I was inquiring about, is very similar to the
Simpson Rectangular series model 127, and the larger 3 1/2" model 27 is
cross
referenced as a Hoyt movement (# 398)

I called Simpson Electric Company in Elgin, IL - talked to Customer Service.
Simpson will normally refer you to one of their repair center across the
country. This is the web page for repair center look-ups:
http://www.simpsonelectric.com/calnr.htm

They have referred me to 2 companies in the Chicago are that may be able
to perform repair work. [I have not yet contacted these companies]

ALCA Instrument Service
9224 W. Grand Ave
Franklin Park, IL 60131
847/451-6644
847/451-6645 - Fax
Test, Analog PM

Davis Inotek Instruments
1064 Tower Lane
Bensenville, IL 60106
630/350-2500
630/350-2899 - Fax
Test, Dig & Analog PM
http://www.davis.com/

Simpson does perform repair work at Elgin, IL for discontinued meters

Simpson Electric Company
Attn: Repair Department
853 Dundee Ave
Elgin IL 60120
Repair costs at Simpson's Repair Center for analog panel meters runs $ 50

Hope this update helps. Perhaps someone with recent personal repair
experiences
or knowledge can add to this research.

http://members.cox.net/radiostuff9/type_k2.jpg

Large Millen Dial - New in the boxï¿½ï¿½..$20 plus shipping
Photos:
http://members.cox.net/radiostuff9/millendial.jpg

National Type SCN Dial - New in the Box.....$65 plus shipping
Photos:
http://members.cox.net/radiostuff9/scn_dial.jpg

National Type ACN Dial - New in the Box.....$75 plus shipping
Photos:
http://members.cox.net/radiostuff9/type_acn.jpg

Matched Pair of Large Millen Dials.....$35 plus shipping
Don't know if these are new but they are in excellent condition
Photos:
http://members.cox.net/radiostuff9/2millendials.jpg

National HRO Drive with Variable Capacitor .....$100 plus shipping
Looks new - no box. Their was a loose PW dial on this hence the marks on
the shaft
Photos:
http://members.cox.net/radiostuff9/hrodrive.jpg
http://members.cox.net/radiostuff9/hrodrive2.jpg

National HRO Drive .....$50 plus shipping
Good condiition - no box.
Photos:
http://members.cox.net/radiostuff9/2ndhrodrive.jpg
http://members.cox.net/radiostuff9/2ndhrodrive2.jpg

National Black PW Dials ..... $75 each plus shipping
Two of these. Here is a chance to replace that chipped up dial on your
HRO receiver.

These look to be new. No box - a couple of very tiny paint chips

# 3400. Drake R4A Slow Warmup -- Undocumented Trimme Cap!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-20 02:03:14 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20030519220314.17796.00000135@mb-m15.aol.com>
Source record: 32224

I *may* have solved the mystery of the Drake R4A that takes about 5 minutes warmup before the 1st mixer cuts in. Faced with an extra band xtal (17.5 - 18 MC) that wouldn't oscillate at all, I nosed around the transistorized master oscillator (that operates all the different band-set xtals) and discovered an undocumented ceramic piston trimmer cap in the circuit. Not in the schematic, not in the photos, not mentioned i the alignment instructions -- as far as the C-I-friggin-A is concerned, it never existed.

Well, touching it with a screwdriver would start the "dead" xtal going. From dim old memories I recalled that some xtal oscillators have a coil or cap adjustment that must be tweaked to get them to start reliably. So I started cranking on this trimmer, 1/2 turn at a time, and pretty soon I got it so that the "bad" xtal would start within one second after being switched in.

Checked all the other xtals, they all work fine at the new setting.
Now to find out, after the rig has cooled down, if the slow-start problem is fixed for any or all bands.

This trimmer may be in early models only, and eliminated by the time the manual was published. Or maybe it's a later addition, and found in R4B as well?

A good thing to know aobut if your Drake won't quack on all bands.
73, Mike K.

One thing I can say about Texas, they sure know how to throw a barbeque. I seen more marbeque establishments than I did McDonalds. But it don't much matter which way I go it's still a long way to either Dayton or Texas. Still a lot of fun though, but I'd see a lot more old friends at Dayton.

$250 Reward, No Questions Asked-
For the return of my Navy AMA radio, serial #205,
which was stolen in 2001 from Greenville, Texas.
An AMA is a WW-II "handie talkie" that looks just like
the famous BC-611 handie talkie, except it has a Navy
nomenclature tag on it and a navy-marked chassis inside it.

Having seen the comments, I'll just speak my own impressions of the SX-190 (and AX -- I have one of each).

Aside from the gorgeous looks and silky solid tuning that others have mentioned, I have to say that the preselector, with its 4 gangs of tuning caps and 2 FET stages, is probably one of the best ever made. And there is a magazine article on how to make it even hotter with newer FETs.

(Since FETs are notably short-lived when anywhere near an antenna, if your SX-190 isn't very sensitive, you might replace your first FET in case it's blown). Same with FRG-7 and a lot of other classic RX.

The audio is pretty good. I find the AM BW a little narrow for quality SW listening. The Q-multiplier can make it even more selective, good for SSB and CW, but already too tight for AM. As a notch filter, it is OK but not as tight as some radios using 50 or 60 KC IFs.

Nice that the ham-band AX has 15.0 - 15.5 31m SWL band. And don't knock the CB range; CB is often the only way to see if an RX is working above 21 MC, now that the hams are fading away with the sunspots.

Too bad there's only one extra xtal position. Drake R4 series has 10!

The VFO and master oscillator are output to rear jacks for a digital freq meter or transceive operation (wonder if Allied-Radio Shack ever imagined a matching TX?).

I got my pair for about $85 apiece. I thought that was a good deal. Much more than that, I don't know. --Mike K.

All of these criticisms are valid, except:

-- The SX190 is already a collectors radio, especially in
excellent or museum quality condition

-- It was a classic radio design of the 70's -- and is
a beautiful thing to look at.

-- When combined with a good filter, such as the
QF1-A or the FL3 by Datong, it's one hell of a radio
for pulling signals out of the mud.

If it's Icom, I doubt it can be considered a boatanchor.

For about twenty years (maybe not that long) there has been no duty
on amateur radio equipment brought into Canada. Of course, I've
never seen the definition of what applies, and I'm not sure how
much trouble it is to get the exemption. The customs people are
hardly technically proficient.

"There is NO duty on any amateur radio equipment, or its associated
accessories and parts. Here are the appropriate customs tariff
numbers to quote when importing Ham equipment into Canada.
You will be required to pay GST on the Canadian value of the items.
Description: Amateur Radio Equipment Tariff Class: 8527.39.10.00
Description: Amateur Radio Parts Tariff Class: 8529.90.11.30"

That's from a two year old post, and I've never tried it. GST
is 7% on the value in Canadian dollars.

You may want to poke around the Radio Amateurs of Canada site
at http://www.rac.ca to see if they have something about this.
Or find the pertinent Canadian government site for customs.

I'm not sure why you are worried about this. It should be
up to the receiver to deal with customs.

Try an enclosure 4x4x8' tall, open at the top. Could possibly me made of rigid insulating material (since it's light) or plywood. Most of the sound theoretically might go out the top and away. Maybe not.

This could be why Onans cost $6,000.

Check with the shipper for their Customs Brokerage fees - some of them
are little short of exhorbitant. If you ship by USPS I think you will
only get charged the GST plus a $5 processing fee.

Oops, I opened up the radio and there are only 3 tuning gangs. Still pretty
good. Though someone was right, it does overload (or is it the mixer) on
strong signals, makes a total mishmash of 40m unless you detune the
preselector.

>The audio is pretty good. I find the AM BW a little narrow for quality SW

Actually when testing tonite I found the AM BW to be plenty wide enough for
good quality. The Q-mult didn't even hurt the AM quality all that much, but
helps peak the signal. The Q-mult does make a nice "tone control" for SSB,
much like passband tuning (which it is, actually).

Should be a simple matter to test - power it up, give it a dummy load and a key, and see if it loads. Shouldn't be very difficult, and you'd surely raise the offer price for a little effort to determine if it works. Even without a dummy load and key - use a 60 watt lightbulb and a wire with a plug for a key (use gloves! - even though it's cathode keyed, don't take chances). You should be able to load the bulb to full brightness if it's working. Listen on any SW receiver with a BFO for the CW note.

# 3440. Heathkit Mohawk RX-1 Receiver - Help!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-21 04:45:56 UTC
From: p34901@hotmail.com
Message-ID: <694df9e0.0305202045.d338bfb@posting.google.com>
Source record: 32113

I just traded my Ham gear for a nice clean Heathkit Mohawk RX-1 receiver which was built (and has been in storage for so many years) by a local Amateur who is presently not available to help. It is facinating just to read the pages of step-by-step instructions on assembling each component of the receiver from scratch in the Manual. Despite all kinds of fancy high tech equipment we currently enjoy I really believe that those were the golden days of Ham Radio - I guessed I missed all that actions...
I find this tube receiver quite charming but I can not clarify SSB signal (It is an Amateur Bands only receiver). Every control seems to work just fine except the CW/SSB-AM switch and BFO. AM signal is loud and clear and volume increases with AF gain as expected but when I toggle the switch to CW/SSB, neither the volume nor the BFO knob has any effect on signal strength or quality. Audio becomes weaker when switched from AM to CW/SSB but this is what I noticed from other receivers as well. But even on CW/SSB setting the volume should still increase with AF gain. Also, I could never clarify the SSB signal. I looked inside and most of the tubes are tested Good. There is one unique tube which does not light - 100 KC Xtal. I am not sure whether it is normal but the part number is 404-6. Is it supposed to be lighted or at least get hot ?... I can see no difference even when this Xtal is pulled out. I am planning to take it to a technician next week, but I thought maybe some Heathkit experts out there had gone through the same problem in the past - I keep thinking that it could be a bad switch or contact somewhere...
Thanks in advance for any suggestion and/or advice...

I have a 9500 Watt (9000 continuous) generator. It is not quiet.
The sides of a wood, or metal enclosure don't seem to muffle the noise
much.

I'm getting ready to install one of the small yard sheds behind the
garage. I will be installing Styrofoam on the walls and ceiling.
There will be a "ridge vent" to add cooling and vents added down low
to bring in cool air.

Not only will I have the sound proofing on the walls, I will be making
some sound baffles and using an extended exhaust stack with the outlet
of the standard muffler feeding a good quality muffler for a small
car.

There are several problems using car mufflers. One is people tend to
use too large a muffler and it can resonate creating a different, but
still loud sound.

Also they can, at times be a bear to fit between the small outlet from
the engine and the exhaust stack. I may even use a double stack to
prevent resonance in the stack.

As some one else mentioned, it's the low RPM generators that are quiet
and they are "expensive", but at least twice the equivalent higher RPM
generators. In mine the generator is louder than the engine at most
frequencies except the exhaust note and there they are close.

It probably would have been easier and no more expensive to have
purchased the water cooled, $8,000, or $9000 Honda, which also happens
to run a long time per fill on the gas tank.

Back in the "Old Corps" when we wanted to "sound proof" the generator used to power the "man portable" radar AN/TPS-21 we dug the generator a foxhole about 6 foot deep. The sound did not carry very far from the hole (horizontally that is) thereby extending dramatically the life expectancy of the radar crew.

Jeff -

You may wish to call Oren Elliot Products. They are located in Edgerton,
Ohio, and their plant facilities have been producing capacitors since
1925.

They are the largest domestic manufacturer of air-dielectric variable
capacitors.
Their web site can be found at www.orenelliottproducts.com.

They have the ability to reproduce or build custom capacitors.
They have many mfg. designs on file and an extensive model collection.

On a big generator, don't overlook how its mounted on the ground. A big machine will send a thunderous roar of vibration thru the earth. They make mounts to minimize this.

If you tune to an AM station and turn on the BFO, do you hear a loud
whistle that changes pitch with the BFO control? if so, your BFO is
working fine and you should have no problme with SSB or CW.

I think that CW/SSB vs AM switch is just the IF filter, and doesn't turn
the BFO on. You need to have the BFO on in order to copy SSB or CW.

>There is one

That's not a tube, that's a 100 KHz crystal used for the calibration
oscillator.

I am planning to take it to a technician
>next week, but I thought maybe some Heathkit experts out there had
>gone through the same problem in the past - I keep thinking that it

>Thanks in advance for any suggestion and/or advice...

Find out if the BFO oscillates. If it does not, get it fixed, otherwise
I suspect you just need more practice with it.

Thanks for the pointer, but Gary and I made a deal in April for a capacitor out of an S-20R. I sent him payment via PayPal on 4/29, he acknowledged receipt via email the next day and then I never heard from him again. He's not answering my emails, so I don't know what's going on there, but I need to find one and I assume I've lost my money and about 3 weeks on that deal.

Thanks and 73,
Jeff

You can narrow it down closer.

I have both '71 and '72. The former has ads, the latter doesn't.

The covers misplaced for my '72, so I can't say if the price went up.

Those ads were somewhat out of place. Yes, similar ads ran in the
ham magazines throughout the year with little or no change, but
what happens if the prices go up? You can't recall the Handbooks.
And oddly enough, considering the Handbook has a new edition each year,
those ads at the back date the book more than actual contents. (Decades
later, the ads are intriguing and sometimes a useful reference, but at
the time I'm not so sue.) I'm also not sure the ARRL knew what to do with
the ads. In 1971, the ads are right at the back, after the index. But
in 1961, the index came last, with the ads before, and then the actual
content.

Whatever caused the ads to disappear, in 1969 they have 52 pages of
ads, while in the '72 Handbook, it's 32 pages.

Here's a thought. In those years the traditional US mfrs were in a
steady decline and the imported rigs were starting to make a lot of
headway in the market.
Most of the imports were being marketed by "radio stores" rather than
the actual manufacturers like today and I suspect those stores (Henry
bring the obvious exception) really didn't have the budget for Handbook ads.
And of course the ARRL has always been plagued with accusations of
showing favoritism when doing reviews of products from their big
advertisers. Can't really do away with them in the magazine, but the
Handbook would be a reasonable place to cut the practice...especially if
the ads weren't coming in anyway.

# 3461. Swan 250C wipes out Power supply to 2 meter rig

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-22 05:24:19 UTC
From: Jos <josuha1954@yahoo.com>
Message-ID: <vcopslkcua7g17@corp.supernews.com>
Source record: 32134

I just got a Swan 250C on the air..When I keyed it the 2 meter Yaesu 212RH
'blinked" on and off three or four times..
The 212RH is hooked to a power supply.
The Swan sounds good..but the 212 RH 2 meter first did not key and now the
Pyramid Power Supply shows a 'protection' light and has no power out at all.
Could RF damage the power supply in this way.
As I said it blinked out when the Swan 250C was keyed..
Weird..
Any ideas?

If my failing memory is correct I can recall vaguely that the catalog
section was deleted either due to the ARRL being a non commercial
organization or something like that and the postage rates on the

handbook would be cheaper without the catalogue section.

No, that's not why the ads were eliminated.

The ads in the back of the Handbook were eliminated because of postal
regulations. The Handbook did not qualify for "book rate" in shipping if it
contained advertisement. (Back then the postage was included in the price of
ARRL publications.) The ARRL folks calculated the ad revenue per Handbook vs.
the increased postage for all Handbooks sold by mail and found that they
weren't profiting from the ads at all.

Remember that the late '60s and the '70s were a time of high inflation. Cutting
costs was essential to economic survival. Which is why they changed the size of
QST and the books from the old beloved 6-1/2 x 9-1/2 size. That size had become
nonstandard with printers, and cost more to print than the large format now
used.

Hi Jos,

Sounds like you have a bad antenna system for the Swan 250, and are
putting a whopping amount of RF into your shack.

All the semiconductors in solidstate gear act as rectifiers for large
RF fields, and produce voltage. If the voltage appears in a bad place,
it can cause a part to be improperly biased, or over voltaged, and
burn out.

Make sure the Swan's coax is good, and has a good shield. Oh, and take
your 6 meter antenna out of your shack and put it outside some distance
away ;-)

The Swan 250C is a nice little radio, but because of the proximity of
6M to the TV channels, many 250 operators were quick to get their
worked all neighbor's TVs certificates.

That's really good news. I saw the note on his web site stating that he wasn't taking any more orders for transformer rewinding because of his job, but he didn't say anything about going away anywhere, so I won't write that deal off yet. I would, however, like to find another capacitor. I have a second S-20R waiting to be restored and the cap in that one looks pretty beat up.

Thaks everyone for the help,

Jeff

I've dealt with Gary Brown before, and everything went fine. Can't explain the problem, but you still may get the capacitor or your money back. It might be worth trying to dig up a different e-mail address from his website(s) or one of his newsgroup posts.

I checked the part number you gave for the S-20R tuning cap and my S-40A service bulletin. They have different numbers. My memory says they look pretty much the same. The difference may be trivial, or maybe not. If you get a tuning cap from a different radio, check it out carefully.

It sets on pneumatic tires and the front of the mount is a rubber
snubber.

There is very little vibration through the ground, but there sure is a
lot of higher frequency noise. OTOH it's a lot quieter than the little
5KW Briggs and Stratton powered one I used to have.

Now that you and Jim mention this, of course that's what happened.
I remember reading something about this at the time, maybe in
the editorial of QST, or further back in the magazine.

I seem to recall Wayne Green mentioning in 73 something along
the same lines. He had to pay full postage rate for sending back
issues (and maybe those magazine style books that he published at
one time) because they had ads and did not qualify for the lower
rate. Never mind that the back issues were old enough that the ads
were mostly out of date at the time.

In situations like this the cause is often RF getting into the supply through the 115vac input or the 13.8vdc output. RF cores on both, near the grounded cabinet may or may not cure the problem. If the power supply went into a crowbar mode due to the RF, then yes, damage could result.

Anyone know the wiring configuration of the 11 pin plug / cable at the back of a FTV-650 as when used with a Yaesu FT-401B?

Big question is it a 1:1 type cable.... where pin one of the radio is connected to pin one of the transverter, pin 2 to pin 2 and so on...or is it something very different???

Could also use a copy of the FTV's schematic, just dont feel like paying "Epay" prices........

Best Regards, Bruce

## 3489. Large 3" Hallicrafters type know wanted:

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-23 20:48:57 UTC
From: yardleyite@aol.com
Message-ID: <20030523164857.09668.00000115@mb-m26.aol.com>
Source record: 32162

Greetings all,
Would anyone have a 3" diamater Hallicrafters type (looks
like the spoked tuning knobs on an SX-28 but 3" instead of 1" diameter) knob
with a pointer; for sale?
If so, please advise.

Thanks for the bandwidth.
Mod-U-Later,
Joe Cro N3IBX

## 3490. HR10B..fixer uper thinking about selling it.

Newsgroup: rec.radio.amateur.boatanchors

I have a Heath HR10B that is now surplus to my needs..(I bought a
better one just recently). Not working but might consider selling or
trading to someone who could/would use it for parts or get it going.
A bit of rust on the bottom plate..might have been stored in a
basement or something. I might be open as well for a swap.
Price approx..$30.00 US plus postage costs. I wouldnt mind keeping the
tubes as spares for my other set. If interested email..73 Earl VE3ab

>Subject: Henry Amp had switch that does not move freely?

Sometimes the shaft will bind in the panel bushing and freeze up..disconnect all couplings and trace the problem down to the guilty part, should be able to dress shafts with fine sand paper or steel wool ,relubricate all bushings ..should clear up the problem ..mark everything before disconnecting ,so you will get it all back in correct position... # 3498. 6N7 good tube for a regen det ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-24 18:09:40 UTC
From: "A. Trent Phillips" <atrentphillipsnojunk@yahoo.com>
Message-ID: <EzOza.13622$rO.1237687@newsread1.prod.itd.earthlink.net>
Source record: 32171
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I am an SWL who has worked on tube rigs before. I have been inspired to build my own regenerative detector and have most of the parts. I was wondering if a 6N7 dual triode would make a good tube. I figured it would. I want to run the thing with 135 VDC on the plate. I am hoping to be able to work as high as the 16 meter broadcast band (just below 18 MHz), but even 19 metres would be quite nice (below 16 MHz).

So, 6N7, a good tube or not. I figured it seemed close to tubes used by hams before in similar apps including a VFO. It also looks to be a good rugged miltary metal tube in good supply (NOS US Army Signal Corps types are easily had for under $10)

In the end I wish to use an Octal based tube becuase it seems more authentic (an easier to work with, and I have parts around) and would like to keep the plate voltage around 90 - 135 VDC to keep battery and power supply configuration simple.

Thanks.

Adam

The 6N7 is a relatively high-power tube. I don't know why you'd want a dual tube with a common cathode. I'd consider a 6J5. The 6SN7 is the dual version of the 6J5 and they were very widely used in early TV sets.

None of these types are at all "authentic" of the heyday of the regenerative detector. Regenerative detectors were long gone before the octal base was introduced. You'd have to go back to at least the 27 or 37. Or the 30 for low-power battery operation. IIRC, 135 V is much higher than the typical B+ supply used for regenerative detectors. Half that seems more familiar from my regen rcvr days.

<< I believe these are for an SX-28A. Take a look. >>

If I recall correctly the SX-28 knobs had an "open frame" appearance - there was no plastic between the spokes between the outer ring and inner hub.

Don

6SQ7 is an excellent tube for the purpose.

Oddly, the other day I stopped by a trash pile on the curb and pulled out a black crackle-finish box with some switches on it. When I took it apart it contained a 6N7, selenium, and plug in coil. There was no output to the circuit. I should have grid-dipped the coil but I just gave the whole thing away.

I have had switch shafts that have built up some corrosion where the
shaft goes thru the shaft bushing. A very small shot of WD-40 to the
affected area, let it sit a few minutes, then you should be able to
work the switch back and forth a few times and it should be fine.

Fellow Drake Lovers

I have for sale the following "drop-in" filters for the Drake R4c receiver.

Network Sciences FL-1500 - 1.5 kHz filter - this one was in the radio when I bought it. Date code is Aug 23, 1977. $50.00 shipped in the USA.

International Radio #2609.2 - SSB 2.1 kHz filter - Purchased this one at Dayton Hamvention last weekend - like new but excess to my needs already. $75.00 shipped in the USA.

Both for $120.00 shipped in the USA.

I take PayPal. Will ship to Canada for slight extra charge.

Email direct if interested to KK4TL@AOL.COM

Thanx for the read - have a SAFE holiday weekend.

Adam

A good regenerative detector should run with less than 45 volts on the plate. Even a low mu triode, such as a IH4 or 30 will often run with 12 to 16 volts B+.

The 6N7 would work, and I suspect almost any dual triode you find would also be satisfactory. The 19 dual triode was used in the Doerle TwinPlex--a Google search should give plenty of info.

Pete

Wonder when the design changed? I have both models, and both have
the solid fillers between the spokes. I wonder if Hallicrafters had several
revisions for each model, when subtle changes--such as the knobs--took
place?

Pete

Yep, I can fix them.. The first step is to get a manual
with a good schematic. Everything becomes clear when you
have the schematic.

If I had to guess what was going on, I would guess that
there are one of the following possibilities:

1) there are more than one filament supply, and the major
one is burned out.
2) many of the filaments are series string, and one filament
is burned out (I don't think this is too likely.)
3) You have 26 tubes that have burned out filaments (again
not too likely, but a tube tester would eliminate this
possiblity.

Yep, a schematic, that would do it.

SX-28s never had the webbed knobs as far as I know. Only the SX-28As had them in response to complaints of broken or cracked knobs on the 28s. Is it possible your 28 has replacement knobs? See http://www.qsl.net/wa2whv/hallicrafters.shtml#difference

# 3523. FREE test equipment to good home, Seattle area

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-25 18:22:38 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <MPG.193aa9b7c876197a989680@news-central.giganews.com>
Source record: 32047
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,sci.electronics.design

OK, folks, I'm fixing to move, and I need to 'donate' some boatanchor test gear. This equipment is in good working order. It was all used on my bench at one time or another, but has since been replaced and is too big/heavy/fragile/cheap to be worth hawking on the 'Bay.

READ CAREFULLY: The following WORKING equipment will be placed BEHIND the condo unit at 10126 NE 63rd Street in Kirkland, Washington (Seattle eastside) at 6 PM tonight (May 25, 2003). BRING YOUR TRUCK OR VAN. THIS IS HEAVY STUFF.

---

- Two Polarad klystron-based UHF/microwave signal generators, similar to http://www.users.bigpond.com/i.foster/images/Polarad-1296-1a.JPG. Both are clean and in excellent working condition. Coverage between them is approximately 800 MHz - 4 GHz continuous with FM and CW modulation. I believe I have at least one manual for these units (they're identical except for frequency coverage).

- One HP 8551B spectrum analyzer with two HP 851B display units, similar to http://www.fairradio.com/hp-851b.html. The 8551B and one of the 851Bs are very clean and in good working condition; the other 851B is in unknown condition. This includes the manuals and HP interconnect cable, but NOT the two BNC-BNC cables you'll need to connect the two units; these are easy to obtain just about anywhere. This is a really cool piece of gear that makes a very-serviceable spectrum analyzer for the 10 MHz - 12 GHz range. Its only drawback is the fact that it weighs about 100 pounds and takes up a lot of bench space.

- Maybe some more excess gear, too, depending on what I find in my storage unit. I dunno.

---

I don't care who picks this gear up, as long as it all finds a good home. IF IT'S STILL THERE TOMORROW MORNING, THE GARBAGE MAN GETS IT.

Again, READ CAREFULLY: I WILL NOT BE HOME. THE GEAR WILL NOT BE AVAILABLE BEFORE 6 PM. DO NOT CALL ME, EMAIL ME, OR OTHERWISE HASSLE ME REGARDING THIS OFFER.

ANY EMAIL I RECEIVE REGARDING THIS OFFER THAT SAYS ANYTHING OTHER THAN "Cool stuff! Thanks, dude!" WILL NOT BE ANSWERED.

I WILL NOT BE ABLE TO RESERVE ANY EQUIPMENT FOR ANY PARTICULAR PERSON, OR MEDIATE ANY DISPUTES BETWEEN PARTIES. :) To the victor go the

spoils!

Cool! Too bad it's 2,500 miles away. I wonder if it emits enough power
to burn..

Does anyone know what resistor values of R22, R23, R24, and R25 used in the
frequency selection board xx53-3040-xx in the Kenwood TM 221A. My radio
which I got at an auction has none and only operates from 154 to 173Mhz. I
want to convert it back to 2meter ham band.
I understand I may have to reset the VCO- Which control is that????
Thanks,
BOB

Collins 51S-1 Round Emblem Receiver This is a General coverage receiver and looks like it was nicely kept. The front panel is WONDERFUL, Looks well preserved, No scratches No dents, Nothing!! Just looks GREAT!!!! Doesn't look like any one ever touched it up, looks original. I was told that the person who had it didn't do any mods or put extra holes in it or anything else. Serial # 7210 I put it on a wire and heard station coming in GREAT! I even listen to AM staions and it sounded great! The cabinet looks pretty good, No dents, and where you lift up lid on cabinet a little paint is worn.. I wouldn't even bother to paint it, Because the rest looks fine. Comes with power cord, No manual.
Price: 1225.00 Plus Shipping

Yep. Anyone who is at the head of the line at 6 PM can claim whatever
they want and sell/give it to whoever else they want.

As it turns out, there was quite a bit more decent stuff in that storage
locker than what I listed. Come get it out of my hair...

Nah, it tops out at about +10 dBm.

The backward-wave oscillator tube in the HP 8551B probably generates
more power. I used it as a 2-4 GHz (er, Gc) signal source before I got
the Polarad generators.

Evidence. People are getting wiser. I have seen a lot of moving around here (#1053, etc). A lot of people seem to be carrying backpacks with multiple pockets, etc. and also other square bags, etc. Many of the devices seem to be quite compact and portable. The older heavier and bigger items are a dead giveaway and pose an exposure risk and possible liability. These Taiwanese and US Chinese etc seem to be working with computerized compact devices built into cars, microwave ovens, rice cooker type of devices, etc. Looks like Seattle and some others here are a liitle behind in the miniaturization.

I'd expect the tube to work fine. The common-cathode dual-triode
regen is a venerable design.
>
> In the end I wish to use an Octal based tube becuase it seems more

There were certainly many, many octal regens made for ham and SWL use,
homebrew and commercial. I wouldn't be surprised if there were more
octal regens than any other tube type (think of all those basic radio
plans and kits from the late '30s through the '50s).

BTW, you'll probably only need about 30V on the detector plate.

73,
Mike, KK6GM

Yeah, well, anything not picked up by 6 gets donated to the CIA Widows,
Orphans, and Implants Fund.

"Chuck Harris" <cfharris@erols.com> wrote

Yep, I can fix them.. The first step is to get a manual
with a good schematic. Everything becomes clear when you
have the schematic.

If I had to guess what was going on, I would guess that
there are one of the following possibilities:

1) there are more than one filament supply, and the major
one is burned out.

**** There is only one 6.3 Volt heater supply in the RA117.

2) many of the filaments are series string, and one filament
is burned out (I don't think this is too likely.)

***** All tube heaters are paralleled in the RA117

3) You have 26 tubes that have burned out filaments (again
not too likely, but a tube tester would eliminate this
possiblity.

*****A tube tester is not necessary.There will almost certainly be a dry (or "cold" solder joint) under the chassis in the area next to the power transformer.There are several individual heater feeds that leave the 6.3 V winding on the transformer,look for the appropriate terminal and check the soldering.
Brian Goldsmith.

# 3537. WTB: C.E. MM-2 Schematic

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-25 23:37:36 UTC

Message-ID: <4tcAa.722942$OV.668382@rwcrnsc54>
Source record: 32060

I really am stuck in the restoration as my copy of the schematic is quite poor and blurry.

If anyone has a good, clean, readable one, please let me know. I would happily pay for a copy of one on which I could read the pin-outs and the voltages !

Thanks !
Bob

# 3548. FS: Tokyou HC-150 Antenna Tuner

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-26 03:52:45 UTC
From: "Dr. Phil" <robert931@sympatico.ca>
Message-ID: <hcgAa.601$ME.172769@news20.bellglobal.com>
Source record: 32072

Offered is a high quality antenna tuner made by Tokyo Hy-Power company
famous for their excellent linear amplifiers.

This tuner is in very good condition with only a few marks from years of
faithful use. Tuning is very quick and virtually effortless. Power
settings are 20W and 200W making it a great choice for QRP or QRO operation.

The tuner will tune coax or random lines and it's small enough for field use
and large enough for you shack.

Tuner is housed in a rugged metal cabinet.

I will ship to lower 48 and Canada for $125USD.

See Pic:

It would take all day for me to get there and I have a mid-sized sedan. I wouldn't have gas to get much past The Dalles or return.

Hey, who else is around Portland that could get it?

I've been to Aberdeen but haven't been to Seattle since '92 (in a college van) so I'm not much on directions.

# 3556. WTB: Collins feet

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-26 12:32:57 UTC
From: Xavier Banesto <retire@means.net>
Message-ID: <ZPnAa.30$Sg1.3677@news7.onvoy.net>
Source record: 32079

I'm looking for a quantity--16, to be precise, of Collins S line case feet. I recently acquired a very nice KWM-2, and associated grey boxes, and someone had removed all the feet from the power supply, speaker and 30L-1 as well as the radio.

I know that Surplus sales has them, but at a huge price. I don't even need them to be original.

Anyone help?

Larry, N0XB
Northfield, MN

This is an attempt at humor about the weight and bulk of older microwave equipment. I don't think it indicates any kind of mental imbalance -- at least, not by my standards.

This is a man who has posted abuses against me as well as conspiracy to commit murder, etc.

He is posting from London/UK which he thinks is a safe haven for hate-mongers / terrorists like himself.

He is probably funded by Church sources (religious faith funding type) or secret organizations run by Church sources or such kooks. He has posted lies and attacks pretty routinely.

It is time to bring such people to book for the crimes that they are committing without batting an eyelid.

It's *criminal* to throw that equipment out. There should be a surplus
outlet in your area that will handle it. Have you tried that?

Those guys builder Pin removed the antenna after several complaints and lots of injuries over a long period of time and basically not allowing me into my bedroom without being burnt.

However, even though the claim is they have done what they could, another party ADT probably came in and installed another internal radar system with a horn under a missing top tile and also the chimney metal top. They continued the burning almost seamlessly while pretending to have stopped it ! It appears to be controlled by the Fire guys because I have seen them pay their respects every time they come nearby. The house is being rented and had several residents - 'white' young couple, latino, German, India-n/Pakistani now, etc. Quite obviously kook-house. The kooks control every square inch around here and can hypnoptise you and put you to sleep (with radiation beams, etc.) within a few seconds no matter where you are in this whole area. Outside the area, there are other means that can do the same thing. From there to instant death is only a small step ie. anyone can be killed at any time with the existing built up infrastructures which are continuing to be refined every day with the latest modulation and polarization etc. to escape detection. A vision of hell that no one seems to be aware of (even the kooks do not know most of it - they just run one instrument as told or allow their homes to be retrofitted with the killing/injuring/torture equipment, etc.) even aware of right around you.

Right- you're probably already on a disability, and that's why you have
so much free time on your hands. Isn't there something you can do to
spice up your same old tired crap about radiation burns? You're getting
quite boring.

Greetings all. Please excuse the off subject request, I am in search of a schematic and/or service manual for a Whites Coinmaster 5000D. Unit seems dead and I am not sure if the coil died or something internal. Could use the resistance readings for the 10 inch coil to help troubleshoot it as well.

Also looking for a schematic and/or service manual for the Bounty Hunter 8400 detector as well. Gladly pay all reasonable costs. Please contact me at my email address. Thanks Don Smith KB6GQA

Pyschiatrists actually refer to it as "magical thinking" and it's one
of the chief symptoms of this disorder.

Just about ANY triode (or pentode for that matter) will work fine
in a regen detector. Triodes usually work best with only 20-45 volts on the
plate, for pentodes make that on the screen grid. There is nothing
wrong with
using a higer plate SUPPLY voltage, just use a resistive plate load (50k
to 220K) and
adjust this value so you end up with somewhere betweeen 20 - 40 volts on
the PLATE.
The 6N7 is both a power tube and a high mu tube, but nothing wrong with
that.
Go to www.lindsaybks.com and look for his book on the twinplex regen
receiver.
This circuit uses a type 19 battery tube, but he shows a version using a
6SL7 tube that will
work fine with the 6N7.

Bill -

I have no idea if there were a French version of the QST published --
however, the referenced item is in the Collectables - Radio and (maybe
Television) category -- and the translation of the item description
translates roughly as "Periodical QST French 1926, issue #22. on radio/tsf
(once again, I would guess that means television) condition average

Check out http://babelfish.altavista.com/ if you want a web page translated,
it can do a literal translation but it reads like a 1960s Japanese/English
user's manual due to abbreviations and idioms.

Upon further examination, the abbreviation TSF doesn't appear to be
television (these are the drawbacks of trying to figure out idioms and
abbreviations in a foreign language.) All the ads with that abbreviation
seem to be tube radios, crystal radios, or literature associated with them.
So something else? Still radio related.

Brian

TSF means something close to "transmision-sans-fils" which means
"wireless". Thats how old radios are referred to in France.
I'm familiar with the category but was wondering about the QST in
particular.

Beats me who it would be. The electronic surplus market in the Seattle area is nothing short of wretched. We have one decent component seller (RADAR Inc. in Bothell) and one high-priced, understocked, but nevertheless appreciated outlet (Vetco in Bellevue).

At any rate, I'm really not interested in hauling the HP 8551B analyzer around, but I was also totally bluffing when I threatened to let the garbage man have it. :) It is one of the most beautiful pieces of engineering I've ever seen, rivalling any of the great Tektronix instruments. The trouble is, although I used it quite a bit back in the early 90s, I've hauled it through my last three moves without even powering it up. That means it's time to pass it to someone who can actually use it. RADAR Inc. wouldn't be an appropriate venue, and Vetco would park it in a corner for the next twenty years with a $1,000 tag on it.

I was surprised, and more than a little bummed, when it sat out overnight after I cross-posted a "FREE!" notice to four newsgroups and three mailing lists. It's now been dragged back inside and promised to a fellow from Portland who emailed me this morning asking about it.

As for the Polarad generators, they're fine where they're at, sitting out in the rain behind my condo. I bought them NOS for $100 apiece several years ago. They're good if you need a drifty, noisy, unlevelled signal, but there are plenty of better (and lighter) alternatives available nowadays for very little money. Unlike the 8551B, I wouldn't lose any sleep over them.

****rest of plea for help snipped*****

Good luck Linda in trying to get someone to help you in here ( I had a 'few'
replies). I had a problem on my Hammarlund HQ129X. I 'thought' (my
mistake) that someone could tell me the problem or walk me through it via
email, but to no avail.

Just a tube problem shouldn't be hard to fix though IMO, if that's what it
is. Sounds like to me that you're going to have to take it to someone 'in
the knows' that will 'unmod' the 'mod.'

Good luck, let me know if you found some help.

I well remember my French teacher in high school (that's back a few years!) referring to TSF as "telegraphie sans fils" or "telegraphy without wires," a common early term the French used for radio or wireless. My involvement with radio then "sparked" the question.

==========

You can download a manual with schematic for free at:
http://bama.sbc.edu

You should then be able to restore the modified circuit to its
original configuration. It would be a good idea to check over the
rest of the set for other modifications.

Best Regards,

Ed

Good for you! for making the effort to connect someone with real
electronics. If you keep on trying, eventually you'll get some
hits, and somebody who didn't even know what 'signal' really means
will get interested.

I learned more from scrounged stuff when I was a kid than I have
from lots of equipment I bought later.

Gee, John, I didn't realize you were a "neighbor." And I was really
hoping that you would have gotten a better response to this. I have
some equipment that I really should get rid of too, and would like to
find some decent homes for it. Some boatanchor type components,
too...things like iron-core power transformers that I'd hate to just
toss. No big plate transformers (other than one that's too high a
voltage for most tubes), but quite a few lower-voltage things in the
few VA up to perhaps around 300VA. But if you can't even get rid of
nice test equipment, maybe it is time to start dumping. :-(

Cheers,
Tom

Well, in all fairness, maybe I shouldn't have expected instant
gratification from an ad posted six hours in advance of the 'deadline.'
Usenet isn't an instant-messaging medium, after all. Plenty of people
expressed interest, albeit from New York and New Zealand!

I've been playing with the 8551/851 for the past several hours; it's
amazing how well it works for something from the early-Apollo era. The
filament-voltage regulation is pretty crappy thanks to some germanium
transistors I never got around to replacing, but the electrolytics seem
to be holding up well and the exotic parts (BWO, IF cavity amplifier,
front-end mixer, CRT) are all still within or better than spec. It's
still got a couple of decades' worth of life in it, I think. Certainly
a much-better spectrum analyzer than the ones people are building with
CATV tuners and the like.

## 3598. HP 8901A ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-27 18:59:40 UTC
From: Henry Kolesnik <wd5jfr@oklahoma.net>
Message-ID: <vd7dd77fb3d3ee@corp.supernews.com>
Source record: 32021

I've got one of these modulation analyzers that has problems and I'm wondering what use besides the counter and power meter function it might have in ham radio. I thought it had a tracking generator but from what I can tell it doesn't so it can't be signal generator but I 'm guessing it has the capability of being a receiver of sorts. Any ideas or a help with a manual appreciated.
tnx
hank wd5jfr

# 3600. WTB: BC-610 Parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-27 20:40:44 UTC
From: Dale Hagert <w0ir@attbi.com>
Message-ID: <0qi7dvg9fi8gtf9uis0mu43o6813h90akm@4ax.com>
Source record: 32022

I am looking for the following items to restore my BC-610-E:
1. Transmitter Tuning Units or cases 3 each. I don't care what frequency. I need to replace my rusty cases
2. P.A. Tuning Knob and Latch. Missing
3; The other 4 knobs are also missing. i.e. meter, band, filament voltage, modulator bias.
If you can help, please let me know the cost shipped to callbook address.

Any help would be appreciated.
Tnx Dale W0IR

if you have large HV transformers to dispose of, search out the tesla coil groups - there is a tesla list that is quite active (it's a closed list, but not that hard to find) - a 10 to 30 KV transformer at a few hundred MA would make a coiler quite happy.

# 3621. How to stabilize the Johnson Ranger VFO?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-28 12:26:28 UTC
From: k5dh@raytheon.com
Message-ID: <UV1Ba.3399$c6.3280@bos-service2.ext.raytheon.com>
Source record: 31895
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Anyone have any serious suggestions on how to
stabilize the VFO in a Johnson Ranger? What
mods have YOU personally done to YOUR Ranger
to improve stability? Anyone have any links
to such info online?

73,
Dean K5DH

## 3622. NCX-3 on Ebay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-28 12:30:41 UTC
From: Tom S <t_stenbraaten@hotmail.com>

# 3623. FS: Open frame POWER SUPPLIES for tube, solid state, more

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-28 16:44:08 UTC
From: ovrreactor@aol.com
Message-ID: <20030528124408.20386.00000500@mb-m01.aol.com>
Source record: 31896

I designed and built an assortment of open frame linear power supply boards for electronic projects.

ALL are completely assembled and tested.
Jumper selectable for 120/240V input
Board dimensions 3.8" x 2.5"
Height is 1.25" or less (fits in 1U rackmount chassis)

6.3 Volt / 650 mA / $29 (tube filament supply)
12.6 Volt / 380 mA / $29 (tube filament supply)
15 Volt / 320 mA / $29 (general purpose supply)
18 Volt / 290 mA / $29 (API pre)
24 Volt / 210 mA / $29 (Neve and 990 pre)
48 Volt / 60 mA / $35 (phantom supply)
90 Volt / 36 mA / $35 (Trans-Oceanic radio, etc.)
120 Volt / 28 mA / $35 (Tube B+, great for subminiatures)

Check my website for pictures and complete specifications. Asking prices do not include CA sales tax and shipping. Credit cards OK when paying through PayPal!

INTERESED? Please respond BY EMAIL to <OvrReactor@aol.com>, do not post.

Best regards,
Tom Mitchell

I don't know about the degree of abuse in your own past postings, but as far as the Police Chief goes, he is missing in action for over one and a half years now, at least, since I first reported these kinds of incidents. You see, he happens to be British too. And no doubt, trying to be the best gentleman in appearances (would that be just like this guy in 1291 ? It is not a good idea to compare people like that.). There seems to be some kind of tracing of ancestry back to the roots of Neander Valley and camaraderie that might be going on here too in parallel with all these torture and injury and killing activities.

He goes and talks with this African American city youth leader who then talks to somebody in the fire department and then to somebody else, etc. And so it goes. Hemming and hawing and watching the fun while I am being injured and tortured and electrocuted and burnt 24 hours a day, especially finessed during the time when I am sleeping. That way there will not be even witnessed proof of the event happening ! What a brainy set of people to have thought up such a macabre ghoulish scheme and put it in operation with infinite resources of ghouls, materials, equipment and vehicles and money and everything !

At last. We've found you. Yes, I am sorry, but you are correct. We have indeed been irradiating you for some time. I applaud your scientific approach in identifying us. Frankly, we thought you'd never figure it out. The ADT trick we tried fools most. Not you. There are other microwave sources in and around your home you have not found however, and we are still very much monitoring you and measuring the impact of this energy on you.

Please - don't mind all the rude and silly comments you're getting in this group. You're talking to US now, directly, no intermediary. Just ignore the group now and talk to us. Only us. The others in this group do not know what YOU and MYSELF are talking about, do they. It's just you and me - and we know far more about you than you might think.

We can see you. Yes, there are cameras as well. Look - up over your head, hidden - yes right there. You knew? Maybe... you're a smart man, and indeed a challenge to us. But we see where you go, and what you do. And yes, we have infiltrated all of the basic services in your neighborhood - you are absolutely correct on that account as well. Very smart, indeed. The specially modified two-way satellite dishes near you have micro-vision cameras as well, enabling us to see your every move in modulated UUHF microwave signals, received here at OCC headquarters in London.

Do not think this is a joking post. You know. Yes. It's all right there just as you suspected. Now it's just a matter of what we do with you now that you know. What do you suggest we do? Is Guy Fawke involved now as well? Death rays are nothing to mess with, my friend. Just how much DO you know? Whom have you told?

You should have stayed silent on this matter and let the work of our engineers do it's job. Now everyone knows, and there will now be a price to pay for your snooping into our affairs. Was it really worth it to shine light on our work like this?

Watch yourself, my friend. Be looking over your shoulder. We have people onto you, and we watch your every move. Your turn is coming, and I regret that you will not much care for the outcome.

You have been warned. It will only get worse for you now. I'm sorry.

We have assumed control.

It's not my radio, but you have completely misrepresented what the seller has posted in your criticism. He started it at 9.99 with no reserve - the selling price will be set by the BUYER. It appears he's been honest in his description and doesn't seem to be giving it an inflated description. It appears to me there is an opportunity to possibly get a nice looking NCX-3 with PS and speaker, even if it's not working, $20 or $30 is a pretty darned good price. Remember, the selling price of this unit will be determined by the BUYER, not the seller.

Dave

One other thing. If you doubt us, perhaps you should take
a walk over to your neighbor's garage, at 1291 I believe.
Listen. Closely. Put your head against the door. You
might hear it. Perhaps this will help you understand.

You are correct - there are THOUSANDS in the US
and British governments paid to know. Paid to send
these signals.

But why do you think? Hmmm?? You've noticed the
effects haven't you? What do you suppose to be the
purpose?

Give it some thought - you may surprise even yourself.
And don't forget to check out 1291. He's one of us.

OCC

It's not because he is British, or of British ancestory. It is because
he thinks you are a kook, and wishes very much he could help you out by
having you committed to a local insane asylum, but he cannot. You
cannot get someone committed these days unless he has demonstrated
beyond a reasonable doubt that he is a hazard to himself, or people
around him. Apparently you haven't gone that far...yet.

As I said, until you do something really dangerous to yourself, your
dementia is your own problem. Even your own family cannot get help
for you unless you allow it. It is your personal responsibility to
go out and get help with your mental health problems.

-Chuck

Get lost creep. You must have a vested interest (policeman or something like that).

Jellyfish that cannot say one word against the creeps that are injuring me even though I have reported to police more than one and a half years ago !!!

Eating government money and spewing garbage and hate.

Hello John,

Adding to your offer, if somebody can pick it up, I have an original wood (reinforced with metal) military transport box for, you guessed it, the 8551. It is a nice construction, with heavy duty handles. I got it with an HP140T mainframe but it is clearly marked in large letters as made for an 8551 system.

Only 'small' detail is that I am in Valencia, Spain ;-)

Regards,

JOSE

As they say, the first step to recovery is recognizing that you have a problem.... I hope that one day soon you can look around and notice that others do not behave as you do, or fear the things you do. That day would be a good one to make your first step.

Best wishes,

-Chuck

Get lost creep. I usually do not need to repeat this refrain. In your case, I am not sure it works. It is called stalking. Obsessive compulsive behavior. Like someone going after another persons 'ass' for no good reason. Hyenas seem to have this problem. When too many of them gather around, it is time for people to realize that their forest is not theirs any more.

# 3647. Trade R390 for HQ180

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-29 14:38:38 UTC
From: Bill Ogden <ogden@us.ibm.com>
Message-ID: <3ED61B6E.D06D3804@us.ibm.com>
Source record: 31918

Anyone in the New York area interested in this trade? The R390 has original meters and knobs Everything works well except (1) the crystal calibrator, (2) the mechanical lock knob for the dial, and (3) the mechanical dial adjust knob. Have extra tubes. In a case, but that is not original.

Am looking for an HQ180 in good condition, with original knobs. Prefer no clock. Must work well.

If you are interested, you probably want to try the R390, and I would want to try the HQ180. Considering the weight of the R390, it makes more sense for you to visit me (with the HQ180) where we can each try the units. I am near Poughkeepsie.

Values on eBay (and hamfests) seem to be higher for R390s than for HQ180s. (I am not talking about perfect specimens that go for huge $amounts$.) I am willing to make an even trade, but expect an HQ180 in pretty good shape.

I am not interested in shipping the R390. Just too much trouble.

>calibrator,

Is there something easy to check when an R390's xtal calibrator is not working? Everything on my R390 works fine except the cal. Since it uses around 4 tubes as flip-flops to divide the 100 KC into 25 KC markers (IIRC?), not suprising this is a trouble spot. Any hints, please?

>Am looking for an HQ180 in good condition, with original knobs. Prefer
>no clock. Must work well.

Unusual not to want a clock, but then you save the hassle of fixing up or apologizing for cracked crystal face, stripped gears in the movement, etc. I had to buy a replacement crystal (cover) for mine, still haven't put it on.

>Values on eBay (and hamfests) seem to be higher for R390s than for

Hope for a 180 with the noise blanker installed. That would even up the trade somewhat.

>I am not interested in shipping the R390. Just too much trouble.

No argument there! 73 es gud luck, Mike K.

Stick a counter with a probe in there and see if the 100 KC oscillator is
running in the first place. Then check the divider tubes.

The R390 is undoubtedly a much better receiver in any technical sense. The filters are great. It is just not convenient for "tuning around". Besides, I loved my old HQ-170 and the HQ-180 is similar.

As I said, this should not be an even trade. However, it is OK with me if I get what I want. People have different tastes. I had a 75A4 for years (as a boat anchor) and never liked it----perhaps because I tend to work rather low-level CW on 10/12/15 meters.)

I seldom turn on any of my boatanchors, unfortunately. My Omni 6+ is too convenient. If I can justify an Orian to myself one of these days (with its general coverage sub-receiver) there will be even less use of the boatanchors.

Hmm... he'll key the mic to see if the transmitter works (with no antenna), but can't figure out how to put a piece of wire into the SO-239 to see if it will receive? Then just quotes the manual to impress us. Sounds like the complaint was right on target.

I like it for tuning around too. My only complaints with the R-390 all have
to do with poor audio quality, especially AM. Some of this has to do with
the filters ringing, some with distortion in the audio deck.

And I _like_ the clock on the Hammarlunds. Great to keep you from missing
a sked.

>As I said, this should not be an even trade. However, it is OK with me if I get
>what I want. People have different tastes. I had a 75A4 for years (as a boat
>anchor) and never liked it----perhaps because I tend to work rather low-level CW on

If I still had my HQ-180, I'd take you up on it in a minute.... but I traded
it for an R-388 twenty years back.

>I seldom turn on any of my boatanchors, unfortunately. My Omni 6+ is too
>convenient. If I can justify an Orian to myself one of these days (with its general
>coverage sub-receiver) there will be even less use of the boatanchors.

I dunno, I have tried a bunch of the newer receivers and I can just pull
more signal out of the muck with the R-390.

I did get to do a comparison with the new Watkins-Johnson signal intercept
system and the R-390. The WJ panadaptor display was amazing, and will identify
each peak on the screen with frequency and modulation, and if you have a
database set up, it will give you an identifier list of what is normally on
that frequency. The audio is done by digitizing the IF and doing the last
IF filtration and demodulation in the digital domain, and the audio quality
is excellent, especially compared with the R-390. But in terms of being
able to pull signals out of the muck it really didn't perform any better.

Here are some neat National and Millen parts for sale. Prices do not
include shipping.

National Type MCN Dial - new in the boxï¿½..$60 plus shipping
Photos:
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

National Type K Dial Assembly - New in the Boxï¿½ï¿½ï¿½..$35
Photos:
http://members.cox.net/radiostuff9/type_k.jpg
http://members.cox.net/radiostuff9/type_k2.jpg

Large Millen Dial - New in the boxï¿½ï¿½..$20 plus shipping
Photos:
http://members.cox.net/radiostuff9/millendial.jpg

National Type SCN Dial - New in the Box.....$65 plus shipping
Photos:
http://members.cox.net/radiostuff9/scn_dial.jpg

National Type ACN Dial - New in the Box.....$75 plus shipping
Photos:
http://members.cox.net/radiostuff9/type_acn.jpg

Matched Pair of Large Millen Dials.....$35 plus shipping
Don't know if these are new but they are in excellent condition
Photos:
http://members.cox.net/radiostuff9/2millendials.jpg

National HRO Drive with Variable Capacitor .....$100 plus shipping
Looks new - no box. Their was a loose PW dial on this hence the marks on

the shaft
Photos:
http://members.cox.net/radiostuff9/hrodrive.jpg
http://members.cox.net/radiostuff9/hrodrive2.jpg

National HRO Drive .....$50 plus shipping
Good condiition - no box.
Photos:
http://members.cox.net/radiostuff9/2ndhrodrive.jpg
http://members.cox.net/radiostuff9/2ndhrodrive2.jpg

National Black PW Dials ..... $75 each plus shipping
Two of these. Here is a chance to replace that chipped up dial on your

HRO receiver.
These look to be new. No box - a couple of very tiny paint chips
Photos:
http://members.cox.net/radiostuff9/hrodial.jpg
http://members.cox.net/radiostuff9/hrodial2.jpg
http://members.cox.net/radiostuff9/hrodial3.jpg
http://members.cox.net/radiostuff9/hrodial4.jpg

I will ship overseas.
You can check my user ID "n7rk" on Eb*y
for a reference as to dealing with me.

Thanks for looking and 73,

Dave N7RK

If YOU know, why don't you help to sanction him/her/it and leave the "X
files" to cable tv?

Yes, I am allowing the crosspost because interested souls are "out there",
but let's shut this one down.

# 3668. Info needed on beautiful hand crafted AM rig

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-05-30 14:31:47 UTC
From: hivoltage@go.com
Message-ID: <de9609de.0305300631.72b5b98c@posting.google.com>
Source record: 31941

Need to know approximate value of AM transmitter in 5 foot, 19 inch rack. Rack hand crafted as is rig. Pair of 805 finals modulated by pair of 811A tubes. 866 mercury vapor rectifiers. While one rack panel has a crystal controlled 809 driver stage the rig is driven by external BC458 (40M) or BC696 (75M) aircraft transmitter since it has the VFO. Plug in B&W Coils for 80, 40 with rig.

Fully restored with new paint job and fully operational. Rig always receives un solicited "beautiful audio" reports. The rig looks commercially made.

OK, I've been folowing this thread and just been keeping silent.
Everyone is intitled to their opions but what does being Canadian have
to do with anything?? You make it sound like if it you buy it from a
canadian you're guaranteed problems!! Strange, I have well over a
hundred feedbacks on Ebay 100 % POSITIVE!! no problems at all.

I'm selling the radio as is. If anybody has any more specific
questions about all they have to do is email me before they bid. Or
don't you know how Ebay works!!

Source record: 31946

I wouldn't worry about it a whole lot Tom. My experience with mud slinging posters is that they usually have a history of their own and not a good one at that. Almost everything I sell either on ebay or over the newsgroups has gone to The States with no problems, and the stuff I give away doesn't generate too much complaint either. Just ignore this junk from jerks.

cheers (ebay id = nkace)

Please see my Hallicrafters PM-23 Speaker up for auction that ends tomorrow.
This is a great sounding
speaker that works well with SX28s, SX42s, etc
Thanks, Charlie Hugg, K5MBX

Source record: 31956

Greetings All,
Would anyone have a manual or could tell me the values etc. of the filter choke type speaker for a Hammarlund Super-Pro 100? I have said radio but no speaker and would like to try to "roll my own" if possible.
This would be for the early (1937) Super-Pro.
Any information will be greatly appreciated!
Mod-U-Later,
Joe N3IBX

The schematic is on nostalgiaair.org but no values are given for the
chokes. However, there is a voltage chart and maybe you can get in the
ballpark to figure out the DC resistance by working backwards to find
the voltage drop.

Just a wild leap...McMurdo Silver went belly up (again) in 1938 and his line was taken up then by EH Scott. McM committed suicide with one of his antique guns in 1948 at the age of 45.
Maybe there are some references via the EH Scott route???

# 3692. 8907 packset 2-way on 3.9 mcs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-01 18:05:02 UTC
From: Netnews Marty <marty@aa4rm.ba-watchHarvestersbegonE.org>
Message-ID: <obSdnbE7iKrT3Uej4p2dnA@giganews.com>
Source record: 31965
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

This is a Olive Drab aluminum-cased battery-operated AM 2-way "GI attache case style" radio that weighs around 6 lbs empty. 12" wide x 11.5" high x 6" deep. Crystal controlled and about 12 battery tubes.

Tubes like 3A4s, 3V4, 1R5, etc. Most code-dated 57-13. The term "8907 packset" comes from a tube placement label.

Carying handle detaches & telescopes out to 10.' Sits on loading coil when mounted.

Here's some pictures.

http://qsl.asti.net/8907/8907-1nn.jpg
http://qsl.asti.net/8907/8907-2nn.jpg
http://qsl.asti.net/8907/8907-3nn.jpg
http://qsl.asti.net/8907/8907-4Ann.jpg
http://qsl.asti.net/8907/8907-4Bnn.jpg

Has anyone ever seen one or, much less, have an origin clue? One hint is there's a tag that says A&TT Atlanta Region P20." Might be a typo, might be a smokescreen

Marty

Dean:
The Ranger should be more than adequately stable as it was designed from the factory. Mod's for the Ranger were never really necessary for the purpose you stated. I would guess that age has crept up on your rig and that therein lies the heart of the problem. If you're versed in vacuum tube electronics then it should be a simple matter of trouble shooting and correction. If not - try to find an old timer who would be willing to look at it for you. At any rate, I would suggest attempting to fix what you have - rather than modifying what, when working correctly, would probably serve you very, very well. Best of luck.

Roger is on target. You will likely find that the NPO caps in the VFO have
aged and become useless.

Another trick that I did on a Valiant was to install a seperate filament
transformer and run it 24/7 on the VFO tube only. Helped quite a bit.

Source record: 31979

I still own the SX-71 which my father bought new in 1949-50. It has a 100kc crystal calibrator installed, third toggle switch added on left-side, between the two originals, with silk-screening?, looks almost original. Does anyone know who sold this kit? I remember this set started life as a black-on-white dial set, I well remember my Dad converting to white-on-black later style. I am curious as to the crystal calibrator, was this a Hallicrafters-sold option, or from the aftermarket? Thanks in advance, Wayne

# 3707. Old Bianchi capacitors

From: "Jose V. Gavila" <eb5agv@ctv.es>
Message-ID: <3EDB1D72.F4EB8BD2@ctv.es>
Source record: 31980

Hello!

I have just got a lot of NOS Bianchi axial capacitors. They range from 1nF to 1 uF and in 160V to 400V voltage ranges. Color is, more or less, a darkened yellow. External layer is hard.

They are European made and, I guess, 60's vintage. Does somebody know them?. Are they another incarnation of the Black Beauties just in another color ;-)?

I would like to use them to repair tube sets as they look bether than modern capacitors... but just if I can trust them.

Regards,

JOSE

THIRD ANNUAL HCRA TAIL GATE PARTY

June 6th
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

SELLERS: $5 (bring your own tail gate or table)

BUYERS: FREE !!!

For more information contact:
Dave, KB1MU at 413-596-6605 or mailto:kb1mu@charter.net

More info on the web at: http://www.hcra.org

The weather has been bad for every flea market in WMA this year, but it looks like we might be spared this Friday. If not there is space inside to accommodate any vendors that didn't bring a tent (but I'm hoping that won't be needed!)

Expect a good selection of donated items to HCRA at great prices. Complete PC's for less then $10, test equipment for $3, a wide selection of VHF/UHF beams, transceivers - this should be a good one. It will even be better when you bring your stuff to sell or show up to buy. Hard to beat the deal, just $5 to get in with a table - FREE admission to buyers. Venture Crew DX will also be on site selling a selection of equipment to raise money for their crew. Please come over and support your local club.

Additionally we will be having raffle prizes, coffee & donuts and even a DJ! You don't want to miss this one. Come early but leave the rain at home!!!

'73 and see you Friday,

Jim, KK1W

I can't shed any light on the calibrator, but I suspect that the white-on-black dials may have included 15 meter band bandspread, which the earlier version lacked.

Message-ID: <6704ad38.0306021447.99da436@posting.google.com>
Source record: 31993

Hi all,

I recently picked up a Globe King 500C that needs to be rebuilt. Most of the parts are there however the VFO section that is located on the power supply chassis is missing. Any chance anyone has a 500C VFO laying around that they don't need??? Any chance a chance a VFO from a Globe Champ 300 or 350 could be made to work?

Thanks,
Brian - W8KHZ

# 3721. Help on value of old junk

Greetings, An old friend is doing some house cleaning and came across the items below. He wants to see if there is any
interest in them and/or any value estimates before dumping them. Thanks,
Mike K0AZ
k0az@arrl.net

Hickok Model 292X crystal controlled microvolt generator. Worked fine last time out, a long time back.

Jetronics Industries Oscilloscope OS-8C/U manufactured for Navy but accompanied by a tech manual put out by Dept. of Army dated July 1971. It appears to be in original packing. Small scope--3", frequency range 0 to 2 MHz vertical and 0 to 500 kHz horizontal. Looks untouched by human hands, probably not even mine.

Precision Model 10-40 tube tester in a moth-eaten looking suitcase.
It used to work fine, but haven't had any occasion to use it in many years.

# 3727. FS Hallicrafters PM-23 Speaker

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-03 01:22:26 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <mLSCa.28147$rO.2594926@newsread1.prod.itd.earthlink.net>
Source record: 31850

For Sale an original Hallicrafters PM-23 speaker in very good condition. There are a few small nicks and scrapes on the cabinet that could be touched up, but overall the paint on the cabinet is in great shape. The front panel has some discoloration. It may need to be repainted. The metal grill over the speaker looks pretty good. There are a few spots of surface rust on the inside of the cabinet, not bad. This PM-23 is one of the more rare versions of this speaker. It has the very large magnet on the back of the speaker. It still has the Hallicrafters label on the black magnet portion of the speaker. The speaker is designed to be connected to a 5000 ohms speaker terminal on the receiver. I connected this speaker to my SX-42 receiver, and it sounds great! Price is $125. Digital pictures available upon request.
Thanks, Charlie

From: Craig Harrison <craigjv3@gbis.com>
Message-ID: <3edc21b4$1_1@news.greatbasin.net>
Source record: 31852

For sale HP 8640B RF signal generator. I think this is the best Generator HP ever made. It gose from 0.5 MHz to 512 MHz AM and FM modulation Output level from +20 to -140 dBm. Frequency lock function keeps frequency constant, and more. Digital readout for ease of use.Has Reverse power protection option. Unit has scratches, but works great. I've aligned several R-390s with this and its the way to go. Makes for great alignment and calibration of any boatanchor.

contact: Craig Harrison at craigjv3@gbis.com

LOL, ya sure ya betcha then.

they should be polyester/foil and pretty stable, both for temperature
and humidity, if they're what I'm thinking of. leads are radial (both
out one side, parallel to each other) and not axial like the old black
beauties, right?

Source record: 31859

I was given this thing years ago, and always entertained the idea of trying to fire it up. Unfortunately, whoever removed it from the airplane merely cut the connecting cables. I need a schematic, but there's not a thing available on the Internet. Does anybody have anything?

FYI, it's from the mid 50s, tunes 190 - 1700 kHz in 3 bands. I have the tuning head, the power supply/audio amp/IF strip assy. and the rotating loop antenna assy. Obviosly, I am missing the directional readout/control head assy. (which wouldn't be needed if I could figure out how to wire it up.)

If nothing else, I could use the tuning head to feed a longwave receiver, if I knew the IF freq. Thinking it may be 145 kHz, like the ARN-59.

It might make an interesting BCB receiver. I don't have your information
as regards schematic, but I would suggest that you try your local
"small" airport. An avionics shop there should have, or could get the
info, as they would be required to certify the unit as operational and
back it up with a signature if they came across one in an aircraft.

What do you think?

Presently rebuilding a Heathkit TX-1 Apache, found a dead modulator tube, checked out prices, new & eBay, knew horror.

I know there's a lot of superstitous bunk out there about audio tubes...certain brands supposedly being far superior than others, regardless of the fact their electrical characteristics are identical...but I'm not an expert on audio tubes....soooo......

Question: Are those new $14.00 "Ei" brand Yugoslavian tubes AES sells good enough for the TX-1 purpose? Or are they truly the "Yugo" of 6CA7's?

Thanks to the group,

Lin/KJ6EF
For email responses, remove "nospam_".

I am not, either. I have heard the old Soviet bloc countries are way
better on QC than the Chinese plants. it sorta depends on tube type and
plant. all else fails, you could call AES and ask, but I expect they or
the soviet EL84 would be OK.

LOL. I've tried several, and the best answer I got was "what in the world do you want with that old crap? And, no, we don't know anything. The guy that might have died 10 years ago."

Apparently, the control head assy. was the routing hub for all the cables. I can figure out quite a few of them. However, the power supply assy. has a primitive card edge connector that doesn't come anywhere near matching anything on the tuning head. DC, B+ and signal feed are not hard to figure out - what's hard is screen, AGC, etc.

Also, the rotating motor in the loop does not respond to DC voltage. I did some research on the ARN-59 years ago, and it needed something like 28 VAC at 450 hertz. Why in the world they did that rather than power it with a straight DC motor is beyond me.

The power supply calls for 14 VDC, so 12 will work. It's a vibrator supply. I might just fire it up and see what (if anything) happens.

Interesting BCB receiver is exactly what I am thinking. I also have the sense whip, which is streamlined and obviously mounted on a wing. Thus, it has a built in phasing system (whip vs. loop) which might allow me to null

noise and pests.

Sensitivity is a given. It has a luscious 4 gang tuning cap that has 2:1 reduction drive, and tons of coils. Many times I have considered pillaging it to get that cap. I still might someday. ;)

## 3746. FS: Vintage SSB Slicer/adapter...

FS: Model SBA-1 Single Sideband Slicer. Works on any receiver with 455 IF or other receiver IF's if you change the built-in IF crystal. It is rack mount and currently in use on an R-390 receiver and works fantastic. Includes manual and looks very good on front panel. Unit has no mods. Has built-in noise blanker and variable AGC. Will send pix to serious buyer. $250.

Hi Lin,

Ei makes good tubes, even though the factory is in what was once known as Yugoslavia. The Ei 6CA7 is a beam tetrode, while all the rest of the current production EL34s are true pentodes. Shouldn't make a hill of beans difference in a modulator. I believe the bottle on the 6CA7 is a bit bigger around than the EL34, if that matters to you.

Ei, Sovtek, Tesla/JJ, Electro Harmonix, and Svetlana EL34s are all good tubes.
Current production tubes are really quite decent these day. I'm not sure if the Chinese EL34 in particular is any good, but even Chinese tubes are getting better. Virtually all of the tubes in current production are audio types, since they have quite a following for guitar amps and audiphile stereos.

Hello Lin,

The Ei 6CA7 are fine. I use them all the time
and they are stout tubes. I have them for $13.75
ea., and I can run them at 500 volts to ensure
the tube works in your Apache.

$18.75 with shipping is the total (no $2.50
handling charge like AES).

Let me know if I can help!

They are fine. The Tesla factory is also making good EL34s today too.

In a pinch, the Russian 5881WXGT will come pretty close to the EL34 specs
and way exceed the 7027 specs. Great replacement for the 7027 if a grid
jumper is in place on the socket.

Get the filament and B+ power in place, then start checking the other
signals.

>Also, the rotating motor in the loop does not respond to DC voltage. I did

28V 400Hz is standard aircraft power and it was probably readily available.
You cannot run those motors at 60 Hz for slow operation because they will
overheat. You might be able to replace it with a similarly-sized DC motor,
though.

>The power supply calls for 14 VDC, so 12 will work. It's a vibrator supply.

There is a lot of hype going around when it comes to tubes. All former east-block tubes are excellent, at least as good as their once famous western made counterparts. Chinese /pacific rim could be a bit iffy, but in terms of price-performance ratio just as good as anything else I would say.

I almost feel we gotta be grateful that companies in former east-block countries and beyond have picked-up the challenge of tube manufacturing again. Without it, this would be a dying technology which would be a loss.

Oh, don't take me wrong, a top of the line tube audio amplifier can't even come close to a well designed solid-state amplifier. But that's not what it is about. With my aging ears I will never be able to hear the difference anyway, and I sure as hell prefer the looks of a tube amplifier above a solid-state amp, especially in a sparsely lit room :-)

If that was installed in an aircraft it would be a non standard device and
would not be usable for navigation ( I think)

I once got some info on a Lear aircraft radio by finding an ex Lear employee at
Motorola.
Motorola bought Lear radio. ( BTW Lear and Galvin started Motorola)

Is that a five wire motor? As I remember that is a selsyn. I am not sure about
that.
You need to figure out how the radio controls the rotation of the loop, or the
loop
reports it's position to the radio. And 400 to 900 Hertz motors are used
because
the have less Iron and are lighter.

Now that I write this I think that is a two phase motor and the radio turns the
antenna
to balance the phase (or strength) of switched direction of the loop signal

>
> The power supply calls for 14 VDC, so 12 will work. It's a vibrator supply.
> I might just fire it up and see what (if anything) happens.

Yes the aircraft had 12 volt systems just like a car, so 12 to 14 volts is
correct.

The motor itself has 4 wires and 2 of them are ground. There is a device around the center shaft of the loop that has about six wires. I'm thinking that's some kind of sensing device to read back to the control head and provide directional information.

## 3761. hammerlund super pro

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-04 23:14:26 UTC

I have an old hammerlund super pro radio in my garage. It is Green and weighs about 60 pounds. The external power supply is missing. I am moving back to Florida and don't have room for it. If anyone would like this radio and you are close to the western Michigan area you may have it. If not it is going in the dumpster.
Thanks
Greg

First this is off topic and at the least the subject should start OT.

Second, she deserves whatever she gets from the jury/court because she lied and covered up.....it she had started out by admitting a "mistake", all it would have cost her was the profits. Remember, Nixon did not authorize or know about the Watergate break in.....he just tried to cover it up which was the big big mistake.

Phil

After thinking about this for a while I seem to remember that there is a switching
circuit that switches the signal and at the same time sends a signal to the motor
The motor is driven to turn the antenna so as to make the motor signal voltage

zero or close to it. So that motor has to remain as is. That basic circuit is described
in Termans Radio Handbook. Unfortunately the handbook does not give the Lear schematic.

So to sum up, the motor voltages come from the receiver signal detection circuits.

Good luck.

Bill K7NOM (been a long time since I thought about these circuits)

Greetings All!
Would anyone have a good pair of 866jr's for sale? I just moved
my Globe King 400B down my basement, went to fire it up and discovered they're
missing!
I know I could solid state'em with diodes but I want to see the purple glow.

Any assistance will be greatly appreciated.
Mod-U-Later (with mercury vapor rectumfryers),
Joe Cro N3IBX

I need a crystal for my SB-303 Heathkit Receiver
One crystal on the crystal switch board
29.895 MHz Y05 PN 404-210
The crystal use for 15 meter (21MHz)
It is possible that this crystal is use on
the SB series also.

Thanks,

Pierre VE2MP

So, the radio itself is "smart" enough to tune the loop to a null by
sampling the detector current? Nice design.

Not an issue for me. All I want is to be able to rotate the loop remotely.
Since I have a huge problem here with power line hash and harmonics

(even past 30 MHz!) I planned to put it in the attic at the highest possible point, and apply the motor voltage via the RF feeds, isolated by capacitors. This appears to be a doubly balanced loop, with two RF leads to the tuner. I'll have to find a suitable DC motor to replace the existing one.

I'll play around with it and keep the group posted. Thanks for all the help so far.

THIRD ANNUAL HCRA TAIL GATE PARTY

June 6th
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

Set-up - 6:30 PM

SELLERS: $5 (bring your own tail gate or table)

BUYERS: FREE !!!

For more information contact:
Dave, KB1MU at 413-596-6605 or mailto:kb1mu@charter.net

More info on the web at: http://www.hcra.org

The weather has been bad for every flea market in WMA this year, but it looks like we might be spared this Friday. If not there is space inside to accommodate any vendors that didn't bring a tent (but I'm hoping that won't be needed!)

Expect a good selection of donated items to HCRA at great prices. Complete PC's for less then $10, test equipment for $3, a wide selection of VHF/UHF beams, transceivers - this should be a good one. It will even be better when you bring your stuff to sell or show up to buy. Hard to beat the deal, just $5 to get in with a table - FREE admission to buyers. Venture Crew DX will also be on site selling a selection of equipment to raise money for their crew. Please come over and support your local club.

Additionally we will be having raffle prizes, coffee & donuts and even a DJ! You don't want to miss this one. Come early but leave the rain at home!!!

'73 and see you Friday,

Jim, KK1W

Brian,

I was incorrect in stating that the Ei 6CA7/EL34 was a beam tube. However, some old American made 6CA7 and the "fat bottle" Russian 6CA7/EL34 are beam tubes that use beam forming plates rather than the supressor grid a "true" pentode uses.

Please see http://www.triodeel.com/ptnotes.htm and look under the heading "Pentodes". I have other references, but that one is the first that I could lay my hands on.

Both the beam version and pentode versions have the same nominal electrical specs, but are built differently. Therefore, the two versions might "sound" different to those with golden ears.

Presumably, the U.S. made 6CA7 used beam tetrode construction so as to avoid patent issues with Mullard, et. al. The U.S. made 6CA7 a had larger bottle than the slender EL34. IIRC, Sylvania was the primary (and maybe only) U.S. manufacturer of the "fat bottle" 6CA7. So the recent Russian fat bottle 6CA7 is, AFAIK, trying to capitalize on the slight differences that audiophiles might appreciate with a beam tube over a true pentode.

The net effect of all this for a modulator is: Nil.

Keep the motor and build a 400 Hz oscillator. Use a capacitor to shift the phase for the second motor winding. Save yourself some mechanical problems.

For me the electrical problems are easier to fix than the mechanical.

Who wasn't convicted of insider trading, as best I recall. So why?

Quite aside from the question of whether the current broad definition of
insider trading makes any sense.

These were made in the UK and imported and sold by Tektronix. Tek may
still have documentation on them.

I remember them as being really, really terrible scopes, not very reliable,
but usable for service work.

# 3795. Lots of HAM gear FS, or trade all for Icom IC-706

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-06 01:00:39 UTC
From: W4UDX <w4udx.nospam@juno.com>
Message-ID: <1yRDa.54844$Wh6.16393@fe02.atl2.webusenet.com>
Source record: 31818
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

The following Items are for sale or will trade ALL for an Icom IC-706 (you pay all shipping):

Yaesu FT-107 HF station:
Ft-107 XCVR, built-in PS, no DMS unit
SP-107P external speaker + patch
YM-34 desk microphone
Owners and service manuals
Works great, very clean, cosmetically has some wear (7.5 to 8)
Carrying handle plastic end-caps are missing but handle works
$300.00 + shipping

Kenwood TM-2550A 2 Meter mobile station:
TM-2550A 45 watt 2M FM XCVR
(Makes a NICE base radio)
Optional tone board
Optional DCL board
Original up/down hand microphone
Quick release mobile mount
Original boxes and manuals
Everything works great and is in excellent shape
$100.00 + shipping

Icom IC-229H 2 Meter mobile station:
IC-229H 45 watt 2M FM XCVR (very small!)
has memories and tones
original Up/Dwn TT hand mic
Original boxes and manuals and mount
Has 2 new LCD panel lamps just installed and includes 2 spares
very good condition and works great!
$100.00 + shipping

Yaesu Ft-209RH 2 Meter HT station:
Yaesu FT-209RH 2M FM Handheld XCVR
optional tone board
MH-12 speaker/mic
Big a!! Periphex NiCad battery (has no "memory effect")
MFJ thin rubber antenna
NC-15 drop-in charger / DC power supply
Quick reference programming manual (not Yaesu published)
Very clean, good condition, works great
$75.00 + shipping

Or trade all for an Icom IC-706 transceiver
must be in good to excellent shape, working correctly in all bands/modes and

include hand mic, optional tone board, DC cable, original manuals and box.
OK if it was used mobile, but not if it's beat all to he$$, and no smoker's
radios please. If interested in trading, email me quickly before I change
my mind!

Thanks!

Question...
I'm not trying to be an a-hole or anything but I wonder why you want to buy one?
I have one and I love it like my brother! Its a superb machine and it'll probably stay in the closet until I'm a SK.
However, the market has made this a really expensive piece of gear. I can see where this makes a lot of sellers happy but from the buying standpoint I just don't understand why someone would pay the going price for any other reason than to stick it in THEIR closet and watch it appreciate more.
My favorite war story....I paid $100 for mine in the early 80s. When I was confronted with moving overseas I hauled all my mess to the Kansas City hamfest in 1984 or 85. I put out the 115 with a price tag of $265. I had a ton of lookers (it really is a primo one) and even the japanese guys were coming over from the Ken-Yazoo booths to take pictures of it. Nobody was buying at 265. But I was impressed with the interest and decided this one might be a keeper and I took away the price tag. It has been in storage ever since and there it will probably stay-I haven't seen it since then :-0
If I was buying and wanted a rx equal to or better than the 115, I'd get a Drake R4-C. I can't think of any other rcvr that comes close except maybe the R4-B.
So thats why I'm posing the question about why you want a 115? I think we all are trying to figger out why some models get so highly inflated price-wise.
-Bill WX4A

And at one-fourth the size and weight, and maybe half the price!

>So thats why I'm posing the question about why you want a 115? I think
>we all are trying to figger out why some models get so highly inflated
>price-wise.

The 115 really looks sexy, and is probalby the last of the true boat anchors
(as in needing help to move it around). But can it be crystalled for other
than the Ham bands, like the R4s, or is it stuck with Ham coverage only? A
Drake R4 makes a really super SWL set. 73, Mike K.

Hallicrafters did sell a crystal calibrator as listed in a 1950 ad. Not sure if yours is what they sold. I suspect it is ..especially if its a plug in unit.
The change in color was indeed to add 15 meters to the receiver as 15 was not available until 1951 or two years after the SX-71 was announced.
I have some old CQ Magazines and in a 1955 CQ there is an article on modifying the receiver. Most of the mods (audio, increasing IF gain) had comments from Hallicrafters Engineering that said don't....I suggest attachment of a sideband slicer as the only mod to make to what you have.
The Sx-71 was a fine RX. One of my Elmers had the Sx-71 and worked the world on 20 and 40.

Hello John C,
there are some manuals for old Telequipment CROs here
but unfortunately not your model.
http://www.thevalvepage.com/servdata/servdata.htm

This site has your manual but wants money.
http://www.sarrio.com/sarrio/rsman4.html

This site is a bit cheaper $23
http://www.w7fg.com/manuals.php?find=T&page=4

This site is even better, they want $10.

Since listing this item I learned that it was part of Direction Finder Set
AN/TRD-10. I have the TM for this set and will copy the excerpts referencing
the T-430/UR transmitter and include them with the sale. They will be:
"Theory of Radio Transmitter T-430/UR" and "Troubleshooting Radio
Transmitter T-430/UR" (Including pictures and diagrams.)

Also, if you substitute a DC motor, won't you have problems with RF noise from the brushes? By the time you get done, the 400 Hz circuit might have been easier.

BTW, I once had parts of a boat compass repeater that included a neat little 12 VDC motor that drove a tiny 400 Hz alternator with permanent magnets in its rotor. Sorry I let that thing go. Mike K.

# 3812. Wanted: Parts for TX-1, RX-1 Apache/Mohawk

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-07 04:39:33 UTC
From: nospam_deepsea_77@yahoo.com
Message-ID: <3ee16929.42614658@nntp>
Source record: 31835

Well, it looks like the Heathkit Apache/Mohawk/SB-10 package I got
has really put the hook in me...<grin>...was up 'til 2 AM going thru
them...looks like I'm going to need some parts (aside from tubes).

RX-1:
Roller dial
Main Tuning knob (satin finish)
Calibration knob (satin finish)

TX-1:
Modulation transformer (someone replaced it with a Collins unit[!])

If anyone has had some good experience with a Heathkit parts source,
or has some of these parts, this "Heath Newbie" would appreciate it.

Thanks to the group in advance,
73 DE KJ6EF

PS-This TX-1 weighs 100lbs...who said this was a sedentary hobby? ;)
For email responses, remove "nospam_".

Source record: 31745

I assume you mean Plate Amperes or Grid Milliamperes (not voltage).
If so, this behaviour is normal. The tubes are cutoff when in idle.

You should still be able to see the Plate Voltage at idle, though.,
typically around 2500v in SSB mode.

Regards;
Neil, K1VY

There seems to be some confusion since the term "idle" has not been defined as (1) the linear is in standby (receive mode), or (2) in transmit with no signal applied. In case (1), there will be no grid current or plate current flowing and in SSB mode the plate voltage will be around 2800-2900 volts when the amp is powered from a 220v power source. In case (2), there will be approximately 80 ma of grid current and plate voltage will still be approximately 2800-2900 volts without any signal being applied. All three of my L7s exhibit these characteristics.

73s,

Evan

You better mean *plate* current, not *grid* current in case 2.

Yes in standby , both meters read 0 , needle is to far left in either
cw or ssb
In standby, no matter what button I push(ep,ig) ,without
transmitting,the meters stay to the far left without any movement.
However I can tune it in cw and put out full power. The needles do
move when transmitting.
Thank You!
Dave

Not sure if the last message went through , so I will just say that
there isn't any plate voltage in standby when in SSB mode.
Thank You
Dave

Hello all,

Would anyone here happen to have laying about collecting dust, and would be willing to sell, a cassette tape drive (for saving data paper-tape style) for a Teletype Model 40 terminal? If so, give me an e-mail at rds@bis.midco.NOSPAMnet.

Thanks,
Ryan

# 3832. Value of Kenwood MC-60 mic, FS?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-09 00:35:18 UTC
From: k9sqg@aol.com
Message-ID: <20030608203518.00956.00000243@mb-m17.aol.com>
Source record: 31755

I have an MC-60 that I got as part of a package deal but I don't have need for it. Nice to have around but if I could sell it for a reasonable price I probably would. Cosmetically, I'd say the mic is an 8.5-9 with one mechanical/electrical qualification. Some of the wires are pulling out from the connectors and they need to be rewired. I haven't tried the mic since it puts the rig into transmit as soon as the plug is inserted into the mic jack. At any rate, I was wondering what such a mic might be worth and am open to offers. If it doesn't sell, I'll wait until I have time to rewire it and then offer it for sale.

Thanks for reading the posting.

73s,

Evan

# 3833. FS: R-1051 Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-09 00:48:26 UTC
From: woodhead <NOSPAMwood3590@yahoo.com>

For Sale: R-1051 receiver in working condition. This digitally tuned receiver was the replacement for the R-390 series of receivers and covers 2.000 to 30.000 MHz, AM, CW, USB, LSB and ISB using mechanical filters. There are two tubes; the rest is solid state. Built-in frequency standard and oven. Non-original panel lights. With some documentation. This is heavy - around 75 pounds, and built like a battleship. Prefer pickup near Oxnard, CA or will deliver up to 50 miles. $100.

I have several pieces of Hallicrafters gear that I may sell. I don't need to sell them but, I'm running out of room and don;t want to store them away. All have been kept in a non-smoking environment.

SX101A works very well with minor scratches. This is very close to full restoration. Copy of the manual.

HT-32A Full output and excellent audio. Has the upsdate errata for the VOX performed. Original manual.

SX-71 works well. Has some pitting on chassis but, case is fine.Copy of manual.

SX-111MKI the one with the detector tube or 16th tube. Works well and looks great. Copy of manual.

HT32A non-working condition. Needs work and case. All parts are there including the tubes. Could be reatored or used for parts.

HT-32 non-working condition. Looks in great shape but, needs power Xfrmr.Has the case and all parts are there including the tubes. Could be restored or for parts.

Reasonable offers or trades. Remember these are Boat Anchors and wiegh in heavy.

I have a Halli T.O. keyer, but sorry, no camera.
The wiring of my T.O. is the most amateurish of any commercial
ham gear I've ever seen. I guess Hallicrafters started
their beginners on keyer wiring, where they could do the least harm.

73,
Ed

Thanks to all of the people who contacted me about the R-1051. I fired
it up today and found it to suddenly be as sensitive as a block of wood.
(About 80 microvolts or worse.)

I opened it up for the first time and replaced both tubes to no avail.
I'll have to do some digging now. I'll either fix it and relist it or
list it as a parts unit.

John

Greetings all,
Could someone please help identify the early Super-Pro I
have? The only ID on it is "model BJ" enscribed on the rear of it. I think it's
a Super Pro 10 or 100 but not sure.

Also, does this model take the electrodynamic speaker? The power supply I got
with it doesn't have a provision for a field coil connection.

Before I put "fire to the wire" I want to make sure what I'm doing so I don't
ruin anything. I plan to use it with a vintage '30's fone transmitter.

Please send all replies to:yardleyite@aol.com

Many thanks,
Joe Cro N3IBX

All,
Anyone have a spare 10.7 MHz xtal in a FT-243 holder for a nice old
Precision E400 sweep generator? And this is really a long shot --
how about 10.775 or 10.625 ? (+- 75 KHz)

Thanks,

-Al KC2HRH

No got'ta a spare, but just recently acquired a real Precision E-400
Crystal. 10.7 MHZ, although in reality, it's 5.35 MHz.

I do have a line on getting "new" ones made from M&H Electronics
(they were my fall back position). HC-6/U can with the fat pins.
It's a direct replacement for the FT-243 holders. $15 each.

Jeff

I don't think JAN will do hem with the .093" diameter pins any more.

MH Electronics will, but they charge more.

You can add the pins easily from the base of old, dead
octal tubes.

# 3872. WTT: Fine Braid Solder Wick

Try International Crystal Manufacturing Company in Oklahoma City, OK
(www.icmfg.com)

I've dealt with them for over 30 years and always been very pleased.
They make anything you want, to order, at very reasonable prices.

# 3877. FS 2 Hammarlund Super Pros in FL pick up only

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-11 14:16:54 UTC
From: ed3320@netzero.net
Message-ID: <5c1af7f1.0306110616.7ec58c7d@posting.google.com>
Source record: 31650

I have two Hammarlund Super Pro radios, less power supplies. One is in very poor condition and the other is poor cosmetically but the inside may be restorable. Pick-up only in Inverness, FL north of Tampa and west of Orlando. Most components are there. I have enough projects planned to keep me busy.
$55 total for both and a manual for $10 additional. If interested, e-mail me for a phone #. I can talk you in on 2M or whatever band you have in the mobile.
73, Ed K4GJ
PS these are not SP-600's, these are the original 1930's Super Pros. I will not ship them-too heavy.

Call ICM or JAN. Tell them what you want. Give them your credit card
and they will bill about $20 per crystal, and ship within a week. Custom
crystals aren't hard to get or expensive.

Ok, here's the info on the Super-Pro. It has 14 tubes, a pair of 42's in the audio, and another 42 and a 76 behind them. THe remainder seem to be 6D6, 6C6, and one that ends in a 7. (6C or D7).

Is there anymore info I can provide? Again, I greatly appreciate you help. I plan to use it with a beautiful HB KW "fone" transmitter from 1938 that uses a pair of RK-63's modulated by a pair of 838's.
Very Best Regards,
Joe Cro N3IBX

Joe,

It is a Hammarlund Super Pro SP-10. It was manufactured in 1936.

The tuning range should be 540 kc to 20 mc in 5 bands. It had an "optional x-tal filter" If it has the x-tal filter, it's designation would be SP-10X.

Cost when new would be: SP-10 $194.00.....SP-10X $211.68

IF was 465 khz. Single conversion. Audio output was 10 watts. No mention of any seperate output on the seperate power supply for a dynamic speaker.

Hope to hear you on the air with it and the transmitter.

Les Locklear
Gulfport, Ms.

Well, it would be the original Johnson relay for a "collectible" Matchbox.
Having the exact original part means a lot to collectors.

OTOH, I've heard that this relay does not switch the high powered xmit RF, but
just changes the rig-feed impedance when on receive, to match older rcvrs with
600 ohm screw terminal inputs, like the HQ-129X. Which explains why this relay
has often been removed form Matchboxes. I think it's missing from mine, too.

Use a heatsink and 63/67 and you should be fine. Keep as far down the leads
as you can and use a big iron so you can work fast without overheating the
lead itself.

Or just use sleeves that slip over.

This is hardly a "modern" crystal, being as how it was original
equipment for a Precision E400. A picture is over on the binaries
group alt.binaries.radio.pictures.

For those of you without access to the binaries group, I'll be happy
to send it to you via email.

# 3895. The GF Transmitter- A Short Essay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-13 00:22:13 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3EE91935.F6B0EEF8@ix.netcom.com>
Source record: 31668

Through the kindness of a local gentleman,
I've recently acquired a GF-1 transmitter,
circa 1934, built by Aircraft Radio Corp.
A.R.C. built all the GF transmitter/RU receiver series
up to the GF-10/RU-15 pair of 1939.

The Navy GF-1 and the Army BC-230 of radio set SCR-183
are very similar- much closer then the later GF transmitters.
It uses three type 10 tubes (CRP-38110),
two as modulators and one as power amplifier.
A 45 Special (CRP-38142, VT-52) serves as the oscillator.

The original GF, built in 1932, delivered 1.5 watts out.
The GF-1 produced 3 watts. The big design change
seems to have come with the GF-2; it and subsequent
GF transmitters gave 15 watts output.

The GF and GF-1 were speced for 6600-7400 KCs only,
but did include a plug-in coil. The coil design
differs from later models in physical construction;
the antenna loading coil tap uses a swing-arm device
with lots of joints for developing intermittent connections.
The coil contacts are also arraigned differently
from those of later production coil sets.
The matching RU-3 receiver also had
a single plug-in coil for 5400-8100 KCs.

After delivery of the GF-1/RU-3 in 1934,
Aircraft Radio Corp. offered an improved design
(now with multiple coils) to the
civilian market as aircraft radio set model 457C.
The military bought this updated design "off the shelf"
and designated it "GF-2/RU-3A"
(1934 seems to have been a busy year for Aircraft Radio).
Subsequent GF/RU sets were based on this design.
While the GF/RU was a very successful Navy set with a
long service life, I do not know how well it did in
commercial service.

The GF-7/RU-9 (1938) and GF-10/RU-15 (1939)
were also produced for the Naval Reserve,
but included multiple TX coil sets.
The popular GF-11/RU-16 set produced by Western Electric
in 1941 was, in fact, not acquired as an aircraft set,
even though the nomenclature plate lists it as such.
Ships 242A specs it for Marine Corps ship installations,

and Hue has documentation on its installation in a
mechanized artillery vehicle. Photographic evidence shows
it in an ambulance and in other types of vehicles.

The last GF/RU set, GF-12/RU-18 by Western Electric,
was procured in 1941.
It is listed with two transmitter coil sets,
3000-4525 KC and 6000-9050 KC.
The RU-17 receiver coil sets do cover from the LF band
to 9050 KC, but have a coverage gap
between 4525 KC and and 5200 KC.
I haven't found a reason for this limited range.
The last two RU designs, 12-volt RU-18 and
24-volt RU-19, were used in general aircraft service
and not specifically assigned to a GF model transmitter.
These were produced by Western Electric in 1941.
Perhaps they were acquired as "upgraded" replacements
for earlier RU-series receivers, much as the third
generation of ATA transmitters was produced
as replacements/spares.

After 1941, the new-fangled GT/RBD
(later renamed ATA/ARA) eclipsed the GF/RU,
although the "roogy-foo" remained in service
with front-line units well into WW-II.
The ATA/ARA itself was to be eclipsed by AN/ARC-5.
Even so, all three sets saw long and distinguished service.

I wonder if there was intentional collaboration between
the Navy and A.R.C. to produce the refined GF/RU set of 1934.
Producing plug-in coils for a single-range set
makes sense only if you're prototyping for a later,
multi-range set. The only other single-range set
in this series was the GF-6/RU-8, produced for the
Naval Reserve in 1938. The GF-6 transmitter covered 2000-4525 KC.
The RU-8 receiver did have multiple coils, but only for
the LF Radio Range band, broadcast band and 2000-5600 KC.
I have a 1934 production A.R.C. Army BC-230 transmitter
that is the "kissing cousin" of the GF-1. Perhaps A.R.C.
collaborated with both services, the Army being satisfied
with the earlier, simpler design and the Navy buying the
later refinements.

If anyone can add to this essay,
many of us would be glad to read it.

Source record: 31669

I have a Stromberg Carlson international and a Zenih wavematic stored away for years, where can I find info on these radios and what are they worth...if anything? They are both in fair cond.

Thanks...Gil

Is the Stromberg Carlson an AWP-8? Thats a pretty decent set and worth
a few bux in the right condition.
Too many Zeniths using 'wavematic' to say what you've got there.
Once you get some model numbers Google will find tons of info.

# 3898. Re: Qusetion about Yaesu FTV-650 /FT401B power plug

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-13 02:27:48 UTC
From: n3rik <n3rik@arrl.net>
Message-ID: <EEaGa.1$Va.0@nwrdny02.gnilink.net>
Source record: 31671

Ok, figured a bunch of things out. IF anyone has the manual for this
beast (FTV 650), I could simply use the pin out/in config of the
transverters power plug.

As for the 401b Im trying to match the ftv-650 to, its power plug goes:

1. 6kd6 heater
2. 6.3vac
3. +150vdc
4. +300vdc
5. +600vdc
6. -100vdc
7. alc

Once again, trying to figure out the pin out/in for Yaesu ftv-650 as
connected to yaesu ft-401b, as Im making a nice new cable for it....

Best Regards,

Bruce / N3RIK

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 15th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2003 Rates

SELLERS

This year each vendor must have a Cambridge Vendor License.
We will do all the paperwork to get the one day Cambridge licenses.
To keep the spaces affordable we are discounting your first space.
To use your spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space - includes $10 Cambridge Vendor License
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space - includes $10 Cambridge Vendor License
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

GF-12/RU-17, not RU-18.

# 3906. HRO-5 coils

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-14 01:25:10 UTC
From: "Roger D. Johnson" <n1rj~@pivot.net>
Message-ID: <3eea7a9c$1_1@corp.newsgroups.com>
Source record: 31679

I was doing an alignment on my HRO-5 coils when I
noticed that the lower freq sets have 2 oscillator
trimmers. None of my manuals or info indicates what
the second trimmer is for. I assumed it was a padder
for the lower end of the tuning range, but when I
disassembled the coil, I found a shorted turn device
that looks like it varies the inductance for low end
trimming.

Thanks, Roger

==========
Roger:

Those coils have a Trimmer, Padder, and an Inductance Adjustment. The
Trimmer sets the high end, the Padder the low end and the Inductance
the middle.

For example, on Coil G, the trimmer is set for 400 KHz, the padder for
200 KHz, and the inductance for 300 KHz. This is how it works on the
HRO-50 and 60 and I believe the HRO-5 also.

Best Regards,

Ed

>Thanks, Roger

Some HRO-5 coils included a bandspread feature. These can be
identified by two calibration charts on the front rather than one.

On a bandspread coilset, the option is selected by moving some
flat-head machine screws between locations on the terminal strips on
top of the coils.

When the screws are in the left-hand holes, the coilset is configured
for wideband operation and calibration is given by the left-hand
chart. When the screws are moved to the right-hand holes, the coilset
is configured for bandspread operation and the dial calibration is
given on the right-hand chart.

According to the manual, the wideband alignment affects the bandspread
alignment, so the former should be done first. If you don't want to
use the bandspread setting, you don't need to do the bandspread
alignment.

I just looked this up in the manual, and it's a monster... seven
secondaries and most of them are tapped.

The only options would be to buy another TV-2 or to have this
transformer rewound.

There are companies that rewind transformers. Some have been
mentioned in recent newsgroup postings. Do a Google search of the
newsgroups.

Good luck!

I'll give you a second response, I REMEMBER that radio. And covet your ownership. The only McM stuff I still have is one 903 in perfect shape and an incomplete one that is VERY well used. He was a great guy BTW, in his younger days, he taught my mother-in-law how to solder. (With a 250 watt iron!) She remembered him fondly till her death a few years back.

Regards

W4ZCB

Your stuff probably sent either side of country to sell. I lost Yaesu FT-2500, FT-1500, several FMRS H-Ts, Freq Ctr, R-S SWR/Pwr Meter and RF test eqpt from van in pkg lot across from police station in west central Oregon. No one saw a thing! Cinch your belt and start over.

Two options: an underfed dog or ultrasonic knockout device with enough delay to get perps in vehicle and render them unconscious. Perfect device has ad in most popular mags. Co. located in Peterborough, New Hampshire, I believe. Also plans did appear in way-back issue of Popular Electronics. Only problem is acquiring ultrasonic transducers. Radio Shack used to carry them but not anymore. Possible use of fishfinder transducers.

Nah, only problem is that either solution would most
likely get you sued for everything you in this day and age.

There's more, McMurdo Silver did close their doors in 1938
due to poor sales, and the assets were purchased EH Scott in
November of 1938.

However, in 1945 Silver formed the McMurdo Silver Co., Inc.
at 1240 Mainstreet, in Hartford CT,
and produced a line of simple ham gear and
test equipment. The 802 was produced from 1947 thru 1948,
sold for 38.95. For what it's worth, the unit is supposedly similar
to an ARRL handbook design--that may be worth investigating.

If there are any serious McMurdo collectors, I do have the matching
VHF twins for sale or trade.

FS: I have a late 50s Transcon 10 mobile trans-converter. This is a very small tube 10 meter AM mobile rig about 10 or 15 watts with a 10 meter converter built in. Was used as a mobile setup using the bc radio as the receiver with converter section. There was a writeup in ER. $55 plus shipping. Thanks -Lew KlNDV
Its in very decent shape and have some paperwork and schematic on it. I can shoot a jpeg too.

I'm not sure exactly what details you may require. If there's anything
covered in the basic literature or schematic I (or BAMA) can help you
with that.
If you have a kit in a box that hasn't been built I would recommend
against doing so given the nutty ebay prices.

-Bill

From: Clay Nicolsen <cnicolsen@msn.com>
Message-ID: <S9qcndwlzKKGE3GjXTWcpw@giganews.com>
Source record: 31706

Okay, so it's solid state, but the sucker's heavy enough to be a boatanchor! And it's point-to-point wired, with every transistor in its own socket!

Just picked this up for a very good price. Receive works great, absolutely perfect mint inside, case and front panel a solid 9. I don't intend to keep it, I'm really just a tube guy at heart, but I'd like to get it working as close to 100% as possible before I put it on ebay.

Here's the question...the phase lock tuning and indicator light isn't working properly. The receiver is fully synthesized, and as you move from one band to the next the light is supposed to flash quickly, then slow and stop as you tune to the correct spot. The light flashes quickly when the radio is first powered on, but then stops. The receiver is also supposed to mute when it's off tune, but the audio never really quiets. Without that phase lock light working properly, selecting each band so that the dial calibration is correct requires a bit of fiddling!

It's really a very lively receiver, with terrific audio. Any ideas or suggestions would be most appreciated. I have the schematic, but not really sure where to start. If anyone knows of a person who is knowledgeable on HRO-500's, let me know. I'm in the Chicago area, and if I could find someone within driving distance (I know, I'm dreaming) that would be super.

Thanks in advance!
Clay

# 3934. HAM-COM 6 meters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-15 15:50:29 UTC
From: Patrick Jankowiak <eccm@swbell.net>

We will be at Ham-Com in Dallas TX (www.ham-com.org) operating 6
meters FM from a PRC-77 and a RACAL TRA-967.

These are man-portable 2 watt units with whip antennas, so this is
mainly for those who will be attending ham-com next weekend (June
20,21,22).

We will be on, in order of preference (to avoid interference),
50.3
50.4
50.5
50.6
52.3
53.0
53.9

These should be accommodating for both military and commercial radios.
If someone shows up with a crystalled radio on another frequency, we
might switch to that one. 51.0 is popular, but it's on the edge of the
DX window and the band may be open.

If you have CTCSS, set it for 150 Hz or we won't be able to hear you
since we are using military radios.

Patrick Jankowiak

Clay posted in part:<< I have the schematic, but not really
sure where to start. >>

Nice receiver.

The BAMA site has the complete manual, which includes excellent discussion of the test and alignment of all sections of the receiver. You will need a sig gen, scope, and vtvm or equivalent.

If you farm out the work, try to be selective so you get someone with the right equipment AND the ability to do the work. It will probably cost a bit to get a qualified repair job done. Mucking around without good test gear can make things much worse. If the good price you got was on eBay, it might have already been worked over by a eBay wannabe repair person. Seems like so many of them want to dive into equipment with recap and trimmer twiddles.

Don

My HRO-500 also arrived with the synthesizer needing alignment -
the band frequency didn't appear in the window when the synthesizer
was tuned to the correct frequency. Alignment was a TRIAL -
not for the faint of heart.
As an interim measure, connect a counter to the J-300 RCA jack
on the back of the radio, and tune the synthesizer so the correct
frequency appears on the counter for the band you want.
See fig 18 of the manual. For instance, to tune the 3.5 to 4 MHz band,
the frequency at J-300 should be 32.75 MHz.

National warned (with the HRO-500 series 88 addendum),
that if a voltage other than ground is applied
to J-14 pin 12, then Q18, Q19 or CR6
may be damaged, disabling the muting circuit.
If Q16 has insufficient beta, it won't be able to mute fully.
(Q16 turns on to mute, to bypass the current normally supplied
to Q14 emitter in the IF amplifier stage).
If grounding J-14 pin 12 doesn't fully mute, change Q16
(PNP Germanium).

Check that you have +12V on J14 pin 4.
On my receiver, Zener CR-13 and Q25 of the regulator
failed, exposing the rest of the receiver to an overvoltage.

Another hint: if the 50 Kc crystal calibrator doesn't work,
replace the electrolytic at Q10 emitter.
(Was changed to 5 uF 25v in Series 88 mods.)

By the way, my receiver was Marine Corps surplus,
although it had no military name plate.

73,
Ed K4PF

>Okay, so it's solid state, but the sucker's heavy enough to be a boatanchor!

To answer your question, on the upper left rear of the chassis (radio front is facing you) is a vertical little chassis with a compression type of trimmer capacitor on it. That's the culprit. I found if i twidled with it, the lock would go in and out. I suspect the mica has aged or has moisture...i suggest replacing it with a rotary one, but at the freq it opwerates (50+ MHz I think) positioning and lead length might not be easily controlled.

# 3939. FS: Narrow CW filters for ICOM & KENWOOD rigs

# 3944. Slow Oscillator in Drake R4A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-16 02:27:00 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20030615222700.18497.00000729@mb-m05.aol.com>
Source record: 31717

You probably know that the Drake R4 is a nice family of boatanchor RX, but there are some sand-trap refugee devices in the LO (local oscillator) circuits. Including the fixed band-set xtal LO as well as the tuning VFO.

I'm pretty sure it's the band-set xtal LO that's taking 3 to 5 minutes of warm-up to start working in my R4A. I'm thinking that this transistor is marginal, just enough gain to oscillate when warm, but not when cold. If an oscillator is not oscillating, its tube or transistor generally draws extra plate/collector current, so this causes the transistor to warm up. Finally, it starts working. (And rarely if ever stops working, though you can see how a thermal on'off cycle could happen).

If it really is the transistor, can I just replace it with any generic Radio Shack NPN silicon, or is it something special? Or should I check for a drifted-up resistor, or a dried up or leaky cap, or what? Just wondering if anyone else has had this problem with a Drake circuit. Tnx in advance, Mike K. AA1UK

Lucky you!

On a receiver of this vintage you should assume many of the electrolytic capacitors have dried out and now are more like poor resistors than good capacitors. This even happens in relatively cool solid-state gear. Especially bad are any electrolytics below 10uf, these have little reserve moisture for their size and are often completely shot after 30 yrs. Even high-quality Sprague 350-D series caps may be totally bogus by now.

I would take a cap-ESR meter to every electrolytic in the radio and replace any caps with more than 5% dissipation factor. If more than 20% of the capacitors are bad, I'd go ahead and replace all of that type, as the remaining ones are not going to get any better with time.

The phase-lock loop has probably drifted out of alignment. If replacing the capacitors doesnt help, it's time to twiddle the PLL adjustments. As otehrs have noted, it's often enough to just get the oscillator to track the frequency display plus the IF frequency.

Good luck,

George

Latest list of stuff asof 6/12
Kinda long but bear with me...

*** All used unless stated NOS/NIB ***
*** All prices are POSTPAID NOT INSURED lower 48 ***
*** For INSURANCE I will quote ***

---Coils and coil stock---
NIB EFJohnson 229-203 1 KW roller coil.
Double pitched coil, 28uH total, shiny, new.
See pix at Surplus Sales of Nebraska web site.
href="http://www.surplussales.com/Ind-VariInd-1.html"
$98

---caps---
I need...
One or two small 270pF or 300pF fixed vacuum caps.
3KV rating plenty.

---solid state tube-replacement rectifiers---
2 matched NIB Sarkes-Tarzian S5251/1N2389, 1600 PRV, 600ma
OK for all except 5R4
$24 pair

2 matched Motorola/SES 1N1239, 2800 PRV, 500ma
OK for all including 5R4
$26 pair

1 each Semicon.Inc 1N1239, 2800 PRV, 500ma
OK for all including 5R4
$13

---transformers---
Collins plate transformer part number 672-0531-009
Rated 115-230VAC 50/60Hz in, 2250VCT at 565ma out.
No load: 115V in, 2580VAC out - 120V in, 2700VAC out.
Black, hermetically sealed, ceramic post terminals.
5 x 5.5 x 6.5H, 26LB, used, looks and works fine.
$125 pickup, plus actual UPS shipping

NIB Triad A-35A 10K plate to 90KCT single or P-P grids.
Unused. Allied catalog says freq response 50 to 10K.
2 x 2 x 2.5H inches. $34

2 each NOS Stancor WF-30 multi-Z interstage AF xfmrs.
Hermetically sealed. 1.5 x 1.5 x 2H inches. $7 ea

---coax relays---
These are Danbury-Knudsen or FXR, silver-plated, flat to 600MHz+,
100W+, BNC coax jacks. See old Allied/Newark catalogs.

FXR, NOS, SPDT, 115VAC coil, 2 x 1.5 x 1 inches, $13

D-K, used, SPDT, 18-24VDC coil, 2 x 1.5 x 1 inches, $13

D-K, used, SPDT, 12VDC coil, 2 x 1.5 x 1 inches $13

D-K, used, SP6T, 12VDC coils, 3 x 3 x 2 inches, $23

Motorola, NOS, SPDT, 6VDC coil, 3 x 2.5 x 1.5,
Ant and Rx BNC, Tx solder terminal, $12

---tubes and sockets---
Eimac SK-610 4X/4CX family socket with mounting tabs. $12 ea
Good low-mileage 4CX250B with above socket. $27

Set of 10 real stetite sockets with snap rings
6 4-pin Amphenol, snap ring mount
4 octal Amphenol, snap ring mount
Some new, some used $13 all

---filters---
Stock HW/SB CW filter
Part no. Model no. Type Bandpass6/60 Used on
404-284-1 SBA-301-2 CW 400 Hz/2 kHz HW/SB 100/101/102
$44

Stock Drake 4-line C-F Networks xtal filter model 5645-2.4L
with carrier xtal 5644.999KHz. $35

Kokusai 455KHz 2.1KHz xtal filter model 455ZU-01H
Hermetically sealed. $17

---xtals---
38.1MHz xtal for Drake 4-line. $6

1 lot of 5 HC-6 xtals. 3.4, 10.4, 17.4, 23.4, 24.4MHz
$16

1 lot of 4 HC-6 xtals. 1.545, 4.545, 15.545, 22.545MHz
$14

If you mean KPT connectors, the civilian versions are available
from Newark Electronics. Look for the Amphenol 96-series connectors.

I normaly never post my ebay stuff onto a newsgroup but these are getting no bids or attention paid to them. I have had these tubes for many years got them in a larger box along with many other transmitting tubes. But I have never found any information for them in any tube book (rca and arrl) or on the internet. Their numbers are C-100-E and they have a very strange grid which is like a slinky toy streached out, and is located very close to the plate as the photos show.

These ARE very interesting tubes!

According to this site: http://www.valve-museum.org/

these tubes were designed to get around the early tube patents...

What looks like the grid is actually the plate! What looks like the plate
is the grid! It's an inside-out tube!

That site shows a picture that is quite different in specifics, but
generally may work
similarly. Your C-100's may be a later variation.

I wonder how well they worked with that miniscule plate and surrounding
grid?

I have just been informed that Trace Inverter Company will not give support to any person who wishes to sevices their own equipment. You must send it into the service center and pay someone else to do the necessary repairs. I have a Trace TS (Tiger Series) inverter which I wish to repair and only requested a schematic. They seem to be so afraid of somone stealing some design secrets that they will not help.

I for one will think twice before using any of their products in the future

It has been my experience that the ones most affraid of someone cheating them, are themselves the ones most likely to cheat. I wonder if that holds true with companies too. Can anyone out there help me in locating a schematic? Will gladly pay all reasonabie costs. Please respond to my email address Thanks Don Smith

Its a matter of liability. If they help you do a poor repair job and
someone gets hurt, they can be sued for millions of dollars. No one who
makes inverters or large power supplies passes out the information
freely. Go ahead and buy a different brand, then try to get a manual.
Good luck tilting at windmills.

>is the grid! It's an inside-out tube!

Something that I read stated that many early triodes were built inside-out, or
with the grid on one side of the filament and the plate on the other. It
appears nobody understood how they worked, especially Lee DeForest, who was
often accused (by Armstrong's attorneys) of not understanding how any of his
circuits or devices worked.

You've probably seen really old schematics with the filament in the middle of
the circle, the grid on the left and the plate on the right. Made for a neat,
orderly drawing, but allegedly some early tubes were built that way! The gain
must have been really low .... Mike K.

Here are a bunch of items for sale. Prices do not include shipping. I
will ship overseas.

Heathkit HO-10 Monitor Scope.....$85 plus shipping
Very good working condition although some chipped paint on the top
of the case. Includes a photocopy of the manual
http://members.cox.net/radiostuff9/heathho10.jpg
http://members.cox.net/radiostuff9/heathho102.jpg
http://members.cox.net/radiostuff9/heathho103.jpg

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-B....$150
plus shipping
Military set of James Millen wavemeters covering 1.5 to 40 MHz.
Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

Two Individual James Millen Wavemeters...$25 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover
on one is broken
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

U.S. Army Signal Corps Flame Proof Key J-5-A....$65 plus shipping
Flame Proof Key J-5-A made by L.S. Brach Mfg. of Newark, NJ. This is a
W.W.II key in very good condition.
http://members.cox.net/radiostuff9/flameproofkey.jpg
http://members.cox.net/radiostuff9/flameproofkey2.jpg

URM-120 Wattmeter....$225 plus shipping
Good working condition, last calibrated in 1999. Includes original
manual and revision
http://members.cox.net/radiostuff9/urm1201.jpg
http://members.cox.net/radiostuff9/urm1202.jpg
http://members.cox.net/radiostuff9/urm1203.jpg
http://members.cox.net/radiostuff9/urm1204.jpg
http://members.cox.net/radiostuff9/urm1205.jpg

Turner P-9D Dynamic Microphone....$40 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

Very good condition externally with a small tear in the cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

National Type ACN Dial - New in the Box.....$75 plus shipping
http://members.cox.net/radiostuff9/type_acn.jpg

National Type MCN Dial - new in the box...$60 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

National Type K Dial Assembly - New in the Box.....$30
http://members.cox.net/radiostuff9/type_k.jpg
http://members.cox.net/radiostuff9//type_k2.jpg

Large Millen Dial - New in the box....$20 plus shipping
http://members.cox.net/radiostuff9/millendial.jpg

National HRO Drive .....$45 plus shipping
Good condition - no box.
http://members.cox.net/radiostuff9/2ndhrodrive.jpgg
http://members.cox.net/radiostuff9/2ndhrodrive2.jpg

National Black PW Dial - $75 plus shipping.....
Here is a chance to replace that chipped up dial on your HRO receiver.
These look to be new. No box - a couple of very tiny paint chips
http://members.cox.net/radiostuff9/hrodial.jpg
http://members.cox.net/radiostuff9/hrodial2.jpg

RCA Capacitance Tester....$40 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with
a mirror.
Working but needs a power cord. I checked it with a cheater cord
http://members.cox.net/radiostuff9/rca_captester.jpg

Three RCA Pocket Reference books for the 1940's and 1950's....$12 plus
shipping
Condition is fair to good. The cover on the 1946 book is missing a very
small piece of the back cover. They are:

1945 Tube Reference Book - Tucson Radio Supply stamped inside
1946 Electron Tube Reference Book - Tucson Radio Supply in gold
on cover
1953 RCA Reference Book (Tubes, Batteries, Parts, Test Equipment)
- Radio Parts of Arizona, Phoenix
http://members.cox.net/radiostuff9/rca_books.jpg

Barker and Williamson Coil Mounting Bar....$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Eimac 450TH/VT-108 Transmitting Tube - $150 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

Triplett VTVM.....$45 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

Eico 324 Signal Generator....$40 plus shipping
Good condition and works well. Includes a copy of the manual.
http://members.cox.net/radiostuff9/ eico324.jpg

HAL Computer RTTY Interface CRI-200....$75 plus shipping
Older HAL unit in excellent cosmetic and working condition. No
documentation but it can still be obtained from HAL.
http://members.cox.net/radiostuff9/hal_cri200.jpg
http://members.cox.net/radiostuff9/hal_cri2002.jpg

Heathkit Electronic Switch Model S-2 with original manual....$25 plus
shipping
http://members.cox.net/radiostuff9/heath_switch.jpg

I will ship overseas.
You can check my user ID "n7rk" on Eb*y

## 3965. FS-ICOM IC-735

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-17 12:39:15 UTC
From: n2ion@aol.com
Message-ID: <20030617083915.09323.00001491@mb-m07.aol.com>
Source record: 31738

FS: ICOM IC-735 HF Transceiver, runs on 13.8V DC. All bands 160 through 10-Meters, general coverage receiver, 100 watts (adjustable) transmitter. All modes CW/SSB/FSK/AM/FM. Works well - includes power cable, manual (missing covers), does not have the little door covering the adjustments (I don't think any IC-735's do).

$400 SHIPPED CONUS

> Good luck tilting at windmills.

Has this idiotic sueing thing really gone that far? I think that means
there should not be schematics available for any equipment at all, which
is clearly not the case. Anyway, would not a disclaimer in the service
manual be enough to circumvent this?

I am more inclined to go with the 'proprietary crap' explanation of this
phenomenon.

# 3968. Sending large files...READ THIS!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-17 16:35:26 UTC
From: Steve <zarco@sonic.net>
Message-ID: <irHHa.3211$%3.200027@typhoon.sonic.net>
Source record: 31741

Gents,
Yesterday I posted to this group that I wanted to buy a manual/schematics
for an SP-600.

Some kind soul sent me a copy via e-mail. Good intentions, and I thank you
for your efforts. However, some of us are still stuck with dial-up
connections
where the *actual* data transfer rate is 1 - 2Kbytes/second (with a
connection
speed of 24K/second). The file sent was 6 megabytes. Do the math....

Needless to say my e-mail was locked up for almost an hour before the
connection to my ISP timed out. Had to delete the file to unlock other
mail I had received. Big waste of time.

PLEASE, if you intend to send a large file via e-mail, tell the person
beforehand, or better yet, tell them here they can download it themselves.

Steve W6SSP
p.s.-still looking for a PAPER copy of the SP-600 maual/schematics

# 3969. WTD: Heathkit HW-202 parts

Steve:

You can download a manual for free at: http://bama.sbc.edu

When I recapped my SP-600JX-26 I removed and replaced 53 Black
Beautys, 28 of them had cracked cases. It's a big job replacing all
those caps, but worth the effort.

Best Regards,

Ed

## 3972. Dial Yellowing

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-17 21:44:52 UTC
From: k6sti@n2.net
Message-ID: <1ef466b6.0306171344.1f0530b8@posting.google.com>
Source record: 31595

Orangeing, actually. I just restored a National NC-57. It came with the dials aged to a lovely deep orange. Except that the bandspread dial reverts to a pale yellow whenever you dial away from the set position. Can I uniformly orange the dial by shining a UV lamp on it? I'm leaving the bandspread off set when not using the receiver, but I'm sure this method will take years.

Brian

The lawyers drove the decision not to give out schematics at APC. Everyone in Engineering knew it was a simple matter to reverse-engineer a unit if someone really wanted a schematic bad enough. Some of the Matrix power boards were potted, but this was a safety issue and was only done as a last resort as it made the boards unrepairable.

# 3978. FS: Hammarlund HQ-129X receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-18 00:28:02 UTC
From: GS <greatsurplus@hotmail.com>
Message-ID: <08f60c687ad54915116258f17758f7e9@news.meganetnews.com>
Source record: 31601
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

For sale:

I've had this Hammarlund HQ-129X for a number of years
and used it to SWL the broadcast bands and lowband
SW. Works quite well - a 'daily driver'.

All original - original knobs, no extra holes or mods that
I'm aware of. Cabinet is clean and straight - some wear
on the front - 3 small chips in the bezel around the tuning
dial. Needs the dial lamps replaced. Very clean inside -
see photos listed below.

Crystal filter works, BFO works. Controls need cleaning -
some are scratchy.

$150 plus shipping via UPS from 98466 - probably around
$20 - $30 depending where you are. I'm near Seattle, WA
if you happen to be local and would like to see in person.

See it at: http://www.greatsurplus.com/page8.html

Email if interested: greatsurplus@hotmail.com

Thanks,

Dave

# 3979. Re: Hammarlund HQ-129X receiver - NOTE

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-18 00:47:46 UTC

Source record: 31602
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

Good grief! Forgot to mention this - I just pulled the
receiver off my shelf after years in the radio room,
and remembered the power cord has been spliced -
the original plug was cut off and a new wire spliced
onto the end. Works great, but makes it not
original I would say.

Thanks!

Dave

# 3980. FS: Heathkit SB-301 in good shape

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-18 01:03:25 UTC
From: GS <greatsurplus@hotmail.com>
Message-ID: <f88cfe192b71993b9092d769f061892e@news.meganetnews.com>
Source record: 31603
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

For Sale:

Good working SB-301 receiver. All original - no extra holes. Has 3 10-meter segments installed. Receives well - even on the high bands (ok - there's not much 10 meter activity, but the preselector peaks up the noise beautifully!). Has only the SSB filter. No dents or dings - lid closes nicely, panel is in great shape. Overall it's about a 7+ I'd say - not a collector piece but is an excellent receiver to pair with an SB-401 for a nice SB station.

I can send photos on request via email.

$135 plus shipping via UPS from 98466. Payment via Paypal is preferred, but can do money orders, etc.

Email for any additional details

Thanks!

Dave WB7AWK

Hello Michael,

> I am looking for a source for an article written by Captain Paul Lee in the
> April 1968 CQ magazine. The article is entitled, "Further Improvements for
> the 51J" and is on page 68 of that issue. I would appreciate it if someone
> has this article and could either scan it and email it or photo copy it for
> me.

I only have one year of CQ magazine... exactly the year I was born. And,
yes, it is 1968 :-)!

So if you don't find another source, let me know and I will scan and
send it to you. BTW, it is a great article; I have a R-388, which is a
51J-3 so I was happy to find it when I got the CQs.

Regards,

JOSE

Jose,

Thanks for your response. So far you are, "the only game in town".
I will let you know if no one else replies in a couple of days.

Thanks,
Michael

This seemed typical of a lot of R4 Rxs. Heard one guy fixed it
by increasing the feedback cap in the xtal osc ckt a bit.
No details here...

I doubt it. These are mass-market items and techie-types who might want to repair their own unit are an insignificant percentage of the market. Believe what you want, but outside repairs affecting sales was simply not considered to have any significance.

Actually, they were tricky to fix, with lots of discrete components, control loops, etc. We had some amazing techs who could track down just about anything, but we also had lots of units where the fets blew up while attempting to repair them.

Maybe it's a matter of size - the 40KVA inverter that was installed at a local
telecom network lab came with complete schematics and parts lists.

Probably since it was sold to professional industrial users, who probably insisted on getting the support info. And whose own engineers and technicians probably couldn't sue if they electrocuted themselves, since they knew what they were doing (more or less).

My experience at Bell Labs was that equipment sold to professionals treated the owners like pros, with regard to schematics, parts lists, etc.

Most consumer gear says "No user serviceable parts inside. Refer servicing to trained technicians." Well, a telecom lab should have a few of those around :-)

That UPS is a capital investment, not a cheap, throw it under the
desk unit like 99% of the UPSs in service. And as you said, It came
with them. Equipment that is shipped without manuals generally means
you won't be able to get them.

Track down a full set of manuals for the L3-Com RCB-2000 telemetry
system, and tell me how many people you had to knock down to get them
out of the plant. They won't even give the test techs a full set of
size E schematics, and there is no service manual. If there was, it
would fill half of a drawer in a file cabinet.

I wrote a letter to the president of a large Japanese electronics company
complaining that they did not provide service data. I got a call back
from one of the vice presidents of their US operation, explaining to me
that most of the people who bought the product I was inquiring about were
"stoned-out guitar players" and that they'd probably wreck the equipment if
they had a service manual.

I see no need to buy products without service data.

Guys:

I am looking for a really nice Eico 720 transmitter. I've seen some on Epay but they are pretty grungy or are dinged up pretty bad. I would like to find a nice one, no mods, not all corroded, not from a smoker. Is there such an animal out there?

Larry 419-433-2930 or email net1@netohio.com

# 4023. New military radio museum web site (50 sets described)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-20 08:20:43 UTC
From: Simon <vk2ua@yahoo.com>
Message-ID: <96g5fvcfif7a8rri986v33ahie4597618m@4ax.com>
Source record: 31546

Hi

For those into military radio, I have just finished a new web site on behalf of Ian O'Toole, VK2ZIO, who owns the Kurrajong Radio Museum. So far data on nearly 50 radios and miscellaneous equipment have been posted to the site with photographs, descriptions and schematics (circuits).

The sets come from a variety of countries including Australia, USA, UK, Canada, New Zealand and Germany. Most date from the WWII period though a number are later.

Its URL is

http://www.froggy.com.au/vk2zio/museum

Further radios will be added as time permits.

Simon VK2UA

Here are a bunch of items for sale. Prices do not include shipping.

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$150

plus shipping
Military set of James Millen wavemeters covering 1.5 to 40 MHz.
Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½$25 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover
on one is broken
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

U.S. Army Signal Corps Flame Proof Key J-5-Aï¿½ï¿½ï¿½.$65 plus shipping
Flame Proof Key J-5-A made by L.S. Brach Mfg. of Newark, NJ. This is a
W.W.II key in very good condition.
http://members.cox.net/radiostuff9/flameproofkey.jpg
http://members.cox.net/radiostuff9/flameproofkey2.jpg

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$40 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

Very good condition externally with a small tear in the cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

National Type ACN Dial - New in the Box.....$65 plus shipping
http://members.cox.net/radiostuff9/type_acn.jpg

National Type MCN Dial - new in the boxï¿½..$60 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Large Millen Dial - New in the boxï¿½ï¿½..$20 plus shipping
http://members.cox.net/radiostuff9/millendial.jpg

National HRO Drive .....$45 plus shipping
Good condition - no box.
http://members.cox.net/radiostuff9/2ndhrodrive.jpgg
http://members.cox.net/radiostuff9/2ndhrodrive2.jpg

National Black PW Dial - $75 plus shippingï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½
Here is a chance to replace that chipped up dial on your HRO receiver.
These look to be new. No box - a couple of very tiny paint chips
http://members.cox.net/radiostuff9/hrodial.jpg
http://members.cox.net/radiostuff9/hrodial2.jpg

RCA Capacitance Testerï¿½ï¿½..$35 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with

a mirror.
Working but needs a power cord. I checked it with a cheater cord
http://members.cox.net/radiostuff9/rca_captester.jpg

Three RCA Pocket Reference books for the 1940's and 1950'sï¿½ï¿½..$12 plus
Shipping. Condition is fair to good. The cover on the 1946 book is
missing a very
small piece of the back cover. They are:

1945 Tube Reference Book - Tucson Radio Supply stamped inside
1946 Electron Tube Reference Book - Tucson Radio Supply in gold
on cover
1953 RCA Reference Book (Tubes, Batteries, Parts, Test Equipment)

- Radio Parts of Arizona, Phoenix
http://members.cox.net/radiostuff9/rca_books.jpg

Barker and Williamson Coil Mounting Barï¿½ï¿½..$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Eimac 450TH/VT-108 Transmitting Tube - $150 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

Triplett VTVMï¿½ï¿½ï¿½..$40 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

HAL Computer RTTY Interface CRI-200....$75 plus shipping
Older HAL unit in excellent cosmetic and working condition. No
documentation but it can still be obtained from HAL.
http://members.cox.net/radiostuff9/hal_cri200.jpg
http://members.cox.net/radiostuff9/hal_cri2002.jpg

Heathkit Electronic Switch Model S-2 with original manual....$25 plus

PlastiKote is a brand name which we can buy here in Canada. They sell a
black wrinkle finish paint which works well if the instructions are
followed. We pay about $13.00 CDN per one spray can.

You guys are a bunch of sourpuss assholes - ya know I get so tired
of folks being flamed here by limp dicked weenies that just grumble
about Ebay and the people that sell there. It is really none of your
fucking business - the seller used 'FA' in his post, so just fucking
KILL FILE THE FA, ok? Geez.

You're just jealous - what else would explain your irrational outbursts?
Clearly the BUYERS on Ebay seem to think the deal is good or they
wouldn't BID on the item, would they.

What a bunch of whiners!

Go back and read my post. My complaint was that the seller won't accept
bids from people with less than ten feedbacks. Which means that I
*can't* buy from him even if I wanted to.

> You're just jealous - what else would explain your irrational outbursts?
> Clearly the BUYERS on Ebay seem to think the deal is good or they
> wouldn't BID on the item, would they.

In this case, only those with ten or more feedbacks.

> What a bunch of whiners!

If it is FA to only a select group, it ought to say so.

> Devarim

Hey, I saw it- went for $900 the first day. It was stunning. Like right off the production line. Never seen anything like it.
Seems prices for boatanchors are pretty soft at hamcom and also in general.
Digital is coming!

Not that I am in favor of eBay links here, BUT..

Ya' know, if you emailed him privately, explained who you were and
your interest in the radio, he MIGHT have accepted a bid from you.
Lot's of sellers on eBay have been burnt by low feedback bidders.
Flamming the seller will only get you permanently blocked from his
auctions.

Have for sale the following Kenwood items:

SP-230 speaker for TS-830S, $55.

MC-60 microphone (not the A model), $50.

Will be selling an SM-220 with BS-8 pan-adaptor as soon as I test it and verify that the electrical condition is as good as the cosmetic condition.

Shipping is extra on all items. Thanks for reading the posting.

73s,

Evan

You'd have a hell of a time reproducing the lettering, unless you know how to do silk screening.

Why not try some kind of restorative measures? Faded paint can often be made to look better if waxed. I know waxing a crackle finish sounds crazy, but it would restore some moisture to the paint surface and help with the faded look.

You could even try Armor All.

At least, no lasting damage would be done.

# 4056. BC-348R re-painting or not

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-21 19:50:28 UTC
From: Engineer <LandRJones@sprint.ca>
Message-ID: <3EF4B704.9C9E8081@sprint.ca>
Source record: 31571

I'd really like the group's opinion...

I have an unmodified and working BC-348R receiver. While the front panel is in fair to good shape, the black crackle paint finish looks a bit tired - the knobs are worn shiny at the edges with paint a bit chipped and there are a couple of small scratches on the front panel. All the exposed black paint is a bit "charcoal grey" in comparison to the "dead black" paint under the dial window piece - nothing really serious but it could look better.

In summary, the set shows a worthy heritage of several thousand hours of use since 1943... receiving words of encouragement to a wounded crew nursing a battered B-25 back to base with half the control surfaces shot out, on one engine, barely holding altitude and still 200 miles to go... Sorry, got carried away! My point is, perhaps it deserves to be left alone with it's memories (but still used, of course, off 28 VDC - not modified for 115 VAC.)

So, the question is - should I paint it or not?

If the answer is "you could...", then how? Would I need to use a "black crackle" paint (alluded to elsewhere; BTW, are there degrees of "crackle"?) or would a matte black be OK? Also, the white lettering near the knobs is slightly raised (still in good shape.) How would I get around that? There's an original sticker on the front (paper) and a riveted plate with model and serial number on it that I certainly don't want to lose - could they be masked off? Looks a bit tricky.

All comments gratefully received and I assure everyone that the set won't be touched unless I get good advice that it can be done properly.

Thanks for all replies,

Cheers,

Roger

Please limit your posts on this group to For Sale and For Auction only.
Preferably "For Auction"

Oh wait a minute, got carried away.

I say -- restore to working condition and leave it as it is.

I have an old BC 348 myself, that I need to get going again. It is in very nice condition physically, but I haven't fired it up for probably twenty years.

Good luck.

This device will iron out those fading SW signals.
Brookline Technologies VS301E Volume Stabilizer featuring adjustable stabilization from 10:1 to 1:1, bypass switch, 3 colored LEDs. $50 plus shipping via USPS Priority Mail. I'm located in Plano, Texas.

This item may be viewed at the following web site...scroll about 2/3 down the page for an excellent photo. Of course you may want to read the review also that compares Brookline Technologies to Sima.

http://members.fortunecity.com/swradios/svs1.html

Much credit to Dave N9EWO for the review and photo

If interested or questions email cool1986@earthlink.net

# 4059. unusual TransOceanic R-520A/URR military model

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-21 20:28:48 UTC
From: Phil Nelson <philnelson@antiqueradio.orgNOSPAM>
Message-ID: <4e3Ja.6859$C83.638581@newsread1.prod.itd.earthlink.net>

This week a TransOceanic owner sent me some photos of what looked like a military TO, asking for help in ID'ing it.

My first impulse was to tell him that he had a "Frankenradio" consisting of a military case containing a later 600 series chassis. The cabinet is covered in green oilcloth and has the metal military tag on the front. The only military TOs that I've seen have the rotary dial and 500-type chassis, and that's what is shown in the TO book. His radio, however, has the slide-rule dial and 600-type chassis. It also has the 110v/200v ballast adapter, but since that was available as a civilian accessory, I didn't give it much more thought and initially told him that his radio looked like a civilian model 600 shoehorned into an earlier military cabinet.

A little more digging revealed a "520A" military model at http://www.transoceanic.nostalgiaair.org/pgallery.htm#h500 , however, and then I found a footnote in the back of the TO book indicating that there was indeed a 600-based military model with the 520A designation. According to the book, a small number of these were built in 1956.

Something for TO collectors to keep in mind if you run across a military set that "doesn't look right" at first glance. A telltale sign is the letters USA printed large in red on the right side of the dial scale.

Regards,

Phil

The chassis and cabinet also have USA stamped on them. The tube
sockets are the saddle-bayonet shield type unlike the other 600 types.

I have one here if you want some images to compare.

From your post, it sounds like you have an appreciation for the history of your radio. My suggestion: don't do a cosmetic restoration on THIS radio. If you'd like to have one thats restored, find another one that most others would consider junk and restore it.

You never know, you may find one that is NIB or mint! There are a LOT of these radios out there.

Steve

# 4063. FS:DX-60B Manual

Original Heathkit DX-60B Assembly and operation manual. Has been marked up. Fair condition, not a "collector's" item by any stretch, but had been owned by the world famous AM'er Irb W2VJZ.

$9.00 includes mailing cost.

Thanks for reading.

Jim

Yes, this one has the USA stamps in back, as well. I don't have any doubts that it's the real deal, and I informed the owner to that effect. Too bad that Bryant & Cones never did a 2nd edition of the TO book. There is a lot of info hodge-podged into the back of the book that would be easier to find if folded into the main text.

(IMHO) if Bryant & Cones hadn't been so arrogant - a lot of "things"
would have been better. Bryant and Cones seemed more interested in
promoting themselves than providing an accurate in-depth work on Zenith.
Too bad - because with the access and source available to them, etc.
they could have turned out the truly definitive work on Zenith. But
instead - we got a regurgitated form of Zenith's propaganda machine's
"legends".

If only the product had lived up to the hype... (yeah - I know - take
your pick).

best regards...

Very nice Realistic DX-302 tabletop digital readout receiver
from about 1980. I bought this myself - I actually worked
at Rat Shack at the time (Yecccchhh!!) Comes with original
telescoping antenna for 'tabletop' use.

Works perfectly.

Thanks for looking

And they might have provided more on the military PR-15 manpack surveillance receiver that they devote a chapter to. I have a later version of that radio, which is mechanically impressivel, if not entirely effective electronically.

Hmmm, I take that back -- after a quick check, that chapter is in "Zenith Transistor Radios" by Norman Smith. It talks a little about the PR-15 but shows only a photo of the earlier ZX-5. Sorry-state, but "portable" only to a GI.

That book could also be accused of perpetuating Zenith hype, though a lot of the praise seems to be true -- I have some of those old Zenith shirt-pocket jobs and they are outstanding. --Mike K.

From: Gerald Caouette <ve6nap@rac.ca>
Message-ID: <jiaJa.12671$JH5.1678512@news2.telusplanet.net>
Source record: 31591

Have recently stumbled across a pair of vintage Marine Radio Racks...
included were
the following Marconi units
Globe span - transmitter
Seagard - receiver
Salvor - transmitter
Auto Key unit for distress calls
Alarm unit
Antenna Switching unit etc.

It seems intact but a small meter face on the alarm unit is damaged and
it is missing two terminal blocks
on the bottom of one of the racks
(some one must have needed them for some other project)
and all the associated interconnect wiring between the two racks
a schematic would be helpful
I was hoping that it might be possible to get one or both
of the transmitters, operational on the amateur radio bands
or if some one is interested I might be persuaded to part with
this find for an appropriate financial incentive
Pictures on request.

Another dead giveaway is the twist-loc tube sheilds on the tubes and
the removable ac line fuse....The civilian model didn't have those
either.

A picture of this model is available on my website at

http://member.newsguy.com/~polezi/r500/h520manual.htm

The picture on this page was ripped from an eBay listing a long time
ago.

(The download link no longer works. I removed the material to make
room for the Beitmans. maybe someday I will restore it).

Source record: 31593

Truth told, I've never seen a BC-348 (or for that matter a '312 or '342) that had been repainted and that was not obviously so. The lettering is, as others have pointed out, the problem. One of my several '348's was repainted at some time and the job was credible; that is to say, the wrinkle paint was pretty good. I was able to help things a bit by burnishing the lettering with a Dremel tool, but its still a re-paint. Pep Boys has wrinkle paint and it does a very nice, uniform job if properly baked. The problem I've had is that the grain is rough compared to that fine WW2 finish. I have yet to duplicate what was done back then. I don't know if its the paint, the layering, or the curing process. l'm able to make an LS-3 look brand new but a BC-348 front panel is another matter.
I kind of like the idea of keeping what you have, in its present condition, and keep up the search for the real keeper. Out of the blue, on Epay, I found an out-of-the-box condition "N" model. The picture in the listing was really bad but I saw a gem in the rough. Sure enough, that's what it was. So, keep looking.....

Pictures at:
http://mywebpages.comcast.net/mnowlen/urm-25d.jpg

Military AN/URM-25D Signal Generator, 10 kHz to 50 MHz Tunes
Continuously in 8 Bands

Perfect match for your R-390 or ANY other radio operating over the
frequency range.

SPECIFICATIONS:
Frequency Range - 10 kilocycles to 50, 000 kilocycles ï¿½ .5%; ï¿½
.05% from 1 mc to 50 mc when calibrated against integral crystal.

Tuning Bands And Range Of Each Band--
(1) Band A --10 to 27 kc
(2) Band B 27 to 80 kc
(3) Band C-80 to 230 kc
(4) Band D 230 to 680 kc
(5) Band E -.68 to 2 mc
(6) Band F 2 to 8.3. mc
(7) Band G 8.3 to 18 mc
(8) Band H -18 to 50 mc

Output Voltage (RF) 0.1 to 100,000 microvolts continuously variable
(across a 53.5 ohm external load).

Types Of Modulation:
Amplitude modulation -0 to 80%, (indicated accuracy within +10%).
Internal modulation frequencies: 400 or 1000 cycles per second + 5%.
External modulation frequency: 100 to 15,000 cycles per second.

Power: 103 to 126 volts, 50 to 1000 cycles, single phase AC.

In very good condition, checked, all bands working. Guaranteed not to
be DOA but otherwise sold as-is due to age

Includes copies of TM 11-5551B URM-25B Full Maintenance Manual and TM
11-6625-278-20P URM-25D Supplement.

$125 + Actual Shipping Cost
Send Zip code for shipping costs.

Knob set from HQ-110 - missing one knob

Note: These are the cast offs from a restoration of an HQ-110 I did last year. Neither of them is perfect - the knob set is missing one piece. But I'd rather see if someone wants them before tossing them out.

I have two Superior Powerstat Model 21 VARIAC Adjustable
Auto-Transformers available. They are new in original packaging with
instructions, knob, dial and hardware. Made in US.

Pictures:
http://mywebpages.comcast.net/mnowlen/superior_powerstat.htm

120VAC input, 0-140VAC, 5 amps output. Must be mounted in a cabinet
or on a panel. Has screw terminal connections.

$60 each plus shipping in Continetal US. Send zipcode for shipping.
No Packing charges.

Please reply via e-mail

Thanks for reading.

I love it! You guys don't see the FCC's plan do you?

This stuff is so incredibly broad banded that it will also affect Standard AM Broadcast, shortwave as well as over the air TV Broadcasts.

Ahhh, but if your rich, you can afford to buy a new Digital AM DAB receiver or XM Satellite receiver to listen to that dimwit Rush Limburger... and of course.....

We ALL have to buy that Digital HDTV if you wanna watch TV over the air or keep your old NTSC TV and pay for a Satellite or cable TV hookup.

Either way, you gonna have to spend money to keep what you got now!

See the plan now ???

No wonder Commissioner Powell jr is getting a big woody over this!

This one technology alone will FORCE everyone to go digital. Like it or not.

So just sit there, take it and don't say anything.

It's what they are hoping for.

1) AM IBOC is fragile enough that I think it would also be affected. And
may never get the stamp of approval because of how bad it sounds. And
because each station
occupies three channels. In itself, AM IBOC may kill AM for most people.

2) Limburger isn't on XM.

Would the interference from these broad banded power line signals
disturb the digital signals as well as analog ?
I know the hdtv is higher up the the analog tv signals.

## 4102. Parting out Halli' S-77a

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-23 23:17:04 UTC
From: jakdedert <jdedert@bellsouth.net>
Message-ID: <wXJJa.1881$QC5.1076@fe02.atl2.webusenet.com>
Source record: 31521

I just got this from ebay. Although it appears to be restorable, I had to balance the amount of work/$$ necessary vs. the end result, and came up with negative numbers.

The cab is complete, somewhat rusty, but restorable. One knob is missing and the tuning/bandspread caps are pretty banged up (plates bent/missing, insulator broken). One tube and most screws also missing; otherwise complete including dial covers etc. Someone installed an iso transformer that I may pull and use on the bench, or in an AA-5.

Anybody need anything? *(Email is not munged.)

# 4104. VTVM Probes - found

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-24 00:37:02 UTC
From: Edward Knobloch <e.knobloch@verizon.net>
Message-ID: <O2NJa.984$QN3.728@nwrdny03.gnilink.net>
Source record: 31529

Fans of the vacuum tube voltmeter know that replacement probes
have become a rarity. The standard VTVM has 11 Meg
input resistance on DC, including a 1 Meg series resistor
in the probe for circuit isolation. The VTVM calibration
assumes the presence of the 1 Meg resistor in all d.c. ranges.
A switch is included in the probe to bypass the isolation resistor
for a.c. or Ohms measurements.

This differs from the standard 'scope arrangement, with 1 Meg
'scope input resistance, and 9 Meg series resistor in the
divide-by-10 probe. So, 'scope probes are not a viable
substitute for the original VTVM probes.

Help is at hand: Fair Radio sells a Triplett probe, intended
for use with the Triplett 601 VOM, which fills the bill for VTVM use.
A slight draw back is that the probe's isolation resistance
is only 680K, instead of 1 Meg, but this only represents a d.c. reading
3 percent higher than calibrated (10/10.68 instead of 10/11
resistive divider). Best part = price, only $4 each, new in box.
Fair Radio P/N 79-267 Test Leads, catalog page 42.
The probe includes a DC-Ohms/AC switch,
and has an RCA connector on the probe cable.

Physically, the probe body is a bit thicker and heavier
than the red probe that came with the Triplett 850 VTVM,
and has a sharp tip, good for piercing insulation.

73,
Ed k4pf

(snip)

Thanks for the good advice.

Made a decision... the panel and box stay as is (may try a
mild clean-up.)

I will paint the knobs with matte black - I've done two
(Band switch and AVC-OFF-MVC) and they look good, better
than chipped bright metal edges, no clash with the panel.

The dynamotor sings, the latent memories remain unsullied,
the war horse lives!

Cheers,

Roger

PS. Has anyone a legible schematic for this (BC-348R)? I
have a faded photocopy that's a bit hard to read - I don't
need it yet for repairs but it would be nice to be prepared
or to keep for posterity.

Tks,

RJ

I know the hdtv is higher up the the analog tv signals.
>
> 73 jimbo
>

Yes it would - your are right that HDTV is much higher up in frequency than analog TV but digital signals by their very nature have a high content of harmonic energy that could reach well into the microwave bands. The FCC knows this and this has been proven to be the case at every working BPL installation. The FCC believes (hopes) that the long lengths of the power lines will attenuate these signals to a low "acceptable" level.

We hams know these long lengths of copper cable as "long wire antennas".

While it does "overall" attenuate some of this RF - Long wire antennas are also famous for having very sharp high gain points and nulls occurring at random points along the length of the antenna. Many VHF and UHF stations have used long wire antennas (with matching tuners) with good results if the point just happens to be going the right (wanted) direction.

Given wide band digital signals on a multiple of frequencies, the results would be fairly unpredictable given the age and condition of the power line and numerous other factors listed in most antenna handbooks.

For HDTV - there would be increased "pixelation" and picture "freezes" but the viewer will never see a classic analog herring bone pattern. If interference is too high, the screen just goes blank and "signal lost" LED would light up.

...and here is yet another happy thought... your Black Plastic WALL WARTS won't filter this BPL RF out. It would simply jump the transformer and diode and head right into the device it's powering.

Because folks - our present electronic devices never expected or were designed to have RF coming through the wall outlet. Hams know well about poorly filtered/shielded consumer electronics. Just imagine the fun this is going to cause! I really feel sorry for those folks that have placed X10's all over their homes!

Digital BPL is actually an old idea in a new disguise. This is NOT the first time RF was injected into power lines for communications purposes.

- hams have been doing this since WWII. Just check out the old QST's during the war years when hams couldn't go on the air. During my college years, I

worked on the campus AM station that dumped (coupled) the transmitter output into the power lines so students could pick up the station in their dorm rooms.

I could pickup our little campus station for miles.

Those power lines "leaked" really well. ;^)

# 4115. FRAUD ALERT for Dale Kight NH6VR

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-24 18:03:00 UTC
From: gdion@engineer.com
Message-ID: <13582197.0306241003.388a0bed@posting.google.com>
Source record: 31538
Cross-posted to: alt.ham-radio.marketplace,rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

This is a friendly reminder that Dale Kight, NH6VR is again
fraudulently posting ads that state he has equipment for sale. Upon
receiving payment, he then dissapears. This has just happened to me
after he posted some equipment for sale through the FT817 yahoo group.
Seems he is repeating his history of three years ago. I have been
collecting a fair ammount of information about and evidence against
Dale to use in court. If anyone else hears of his renewed activity,
please let me know. Wish I had known of this two weeks ago...

He has historically used the following e-mail addresses:
nh6vr@yahoo.com (current)
nh6vr@aol.com
nh6vrdale@aol.com
dale@kight.com
drkight@webtv.net

You can easily find his spam through searches of Google groups.

He operates a repeater by said call in Maui, Hawaii.

He owns a store called "Treasure Island" two blocks from his residence
in Maui.

He also has a record with the US Postal Inspection Service documenting
past mail fruad claims.

Court documents relating to restraining orders and garnished wages
against him can be found at the Hawaii State Judiciary website at
http://www.courts.state.hi.us/index.jsp and by searching for "Dale
Kight".

So, let this serve as a warning to steer clear of Mr. Kight unless you
too want to become engaged in legal claims against him.

-Gary, N4TXI

I am seeing more and more Scams on the internet swap pages these days. I thought I had checked out the last guy that I was buying a rig from enough to send him or her a US Postal Money Order .. but I did not check far enough. You think that it will never happen to you. That is what I thought, but I was wrong. Your local Police Department will take your Theft by Deception report and then tell you that it is out of their jurisdiction and to contact the FBI Internet Fraud Division, they will just send you to a site on the internet to fill out a damn form, The much talked about and feared United States Postal Inspectors will just send you a form in the mail to fill out and it contains these encouraging words:

"Postal Inspectors base mail fraud investigations on the number, substance, and pattern of complaints received from the public. While the Postal Inspection Service can't guarantee that you'll recover money lost to fraud, the information can help alert Inspectors about new fraud schemes and prevent others from being victimized."

So I guess my $650.00 report will go to the back of the bus on the bottom of the stack.

Also the local Police Department in the town where the thief lives will tell you they can not do anything unless your local PD requests it. But we have learned by now that it is "out of their jurisdiction".

SO.... I have learned by this experience that unless you loose a $ 500,000.00 or get scammed 5,000 times, just go fill out the damn forms and shut the hell up.

This is just my experience and opinion and just FYI, (for your information).
Please do not email me and tell me what I should have done unless you are sending money in your attachment. :-)

PS: I also reported my Fraud to the Attorney General of Arkansas and signed it:
Arkansas Voter. That might be the only one that will look in to this Fraud.

This is K5JOE saying Happy Hammin', watch your back, and keep one hand on your billfold. Only buy from people that have been on the swap pages for a while with a good reputation.

I will offer my services to receive equipment and payment for that equipment and check the rigs out on my bench before shipping them on to the buyer and sending the payment to the seller... Might charge 5%

to the buyer and the seller over the shipping cost but it would be
better than paying $2000.00 for a rig that did not work or sending
money to someone that will steal it and not send you anything.

If anyone is interested in doing that let me know... I am tired of
seeing all the thieves get over on everyone and get off scott free...

SCAMMED in LITTLE ROCK, K5JOE
73 and Happy Hammin' to all

Well, I wouldn't mind having the case, as a "I can do anything I want to
it" alternative for my S-77A. However, I can't see how, with what you'd
probably want for it, adding the shipping (it's heavy) that it would be
financially viable for me. So......

## 4132. Still parting out S-77a

Newsgroup: rec.radio.amateur.boatanchors

I just got this from ebay. Although it appears to be restorable, I had to balance the amount of work/$$ necessary vs. the end result, and came up with negative numbers.

The cab is complete, somewhat rusty, but restorable. One knob is missing and the tuning/bandspread caps are pretty banged up (plates bent/missing, insulator broken). One tube and most screws also missing; otherwise complete including dial covers etc. Someone installed an iso transformer that I may pull and use on the bench, or in an AA-5.

Anybody need anything? *(Email is not munged.)

# 4133. For Sale: HW-8, DX-40 and Much More

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-25 21:34:48 UTC
From: Dave Hollander <n7rk@cox.net>
Message-ID: <3EFA157A.4D4EFF23@cox.net>
Source record: 31457
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,alt.ham-radio.marketplace,rec.radio.amateur.equipment

Here are a bunch of items for sale. Prices do not include shipping.

Heathkit HW-8 QRP Transceiverï¿½ï¿½ï¿½$125 plus shipping
A very clean HW-8 that works well on both transmit and receive. The main
tuning knob has some minor damage. As shown
in photo. Includes a photocopy of the manual
http://members.cox.net/radiostuff9/heathhw81.JPG
http://members.cox.net/radiostuff9/heathhw82.JPG
http://members.cox.net/radiostuff9/heathhw83.JPG
http://members.cox.net/radiostuff9/heathhw85.JPG

Heathkit DX-40ï¿½ï¿½ï¿½$100 plus shipping
Good front panel, case needs repainting, has the crystal door. Wiring is
clean inside and all of the tubes are good. Correct
knobs on the front but missing the knob for the crystal switch. The
transmitter appears to have a blown power transformer
but includes a non-Heathkit replacement which is rated 600 volts CT at
200 mA. Includes a photocopy of the manual
http://members.cox.net/radiostuff9/heathdx401.JPG
http://members.cox.net/radiostuff9/heathdx402.JPG
http://members.cox.net/radiostuff9/heathdx403.JPG
http://members.cox.net/radiostuff9/dx40.jpg
http://members.cox.net/radiostuff9/heathdx405.JPG
http://members.cox.net/radiostuff9/heathdx406.JPG

Lionel J-38 Telegraph Keyï¿½ï¿½.$50 plus shipping
The J-38 was made by a wide variety of manufacturers including the
Lionel
Electric Company, the same company that made Lionel Electric Trains.
This key is in nice condition. The photo shows the
Lionel "L" stamped into the back side of the base.
http://members.cox.net/radiostuff9/lionelj38.jpg
http://members.cox.net/radiostuff9/lionelj382.jpg

Two Individual James Millen Wavemetersï¿½ï¿½ï¿½$25 plus shipping
One covers 3.5-6 MHz, the other covers 18-40 MHz. The plastic cover
on one is broken
http://members.cox.net/radiostuff9/millenwm.jpg
http://members.cox.net/radiostuff9/millenwm2.jpg
http://members.cox.net/radiostuff9/millenwm3.jpg

Heathkit Electronic Switch Model S-2 with original manual....$25 plus
shipping
http://members.cox.net/radiostuff9/heath_switch.jpg

Turner P-9D Dynamic Microphoneï¿½ï¿½ï¿½.$40 plus shipping
Dynamic Microphone made in Cedar Rapids, Iowa. This mike works and is in

Very good condition externally with a small tear in the cloth
http://members.cox.net/radiostuff9/p9d2.gif
http://members.cox.net/radiostuff9/turner_dynamicmike.jpg

RCA Capacitance Testerï¿½ï¿½..$35 plus shipping
Capacitance tester from the 1940's. Uses a magic eye tube reflected with
a mirror.
Working but needs a power cord. I checked it with a cheater cord
http://members.cox.net/radiostuff9/rca_captester.jpg

Three RCA Pocket Reference books for the 1940's and 1950'sï¿½ï¿½..$12 plus
Shipping. Condition is fair to good. The cover on the 1946 book is
missing a very small piece of the back cover. They are:
1945 Tube Reference Book - Tucson Radio Supply stamped inside
1946 Electron Tube Reference Book - Tucson Radio Supply in gold on cover

1953 RCA Reference Book (Tubes, Batteries, Parts, Test Equipment) -
Radio Parts of Arizona, Phoenix
http://members.cox.net/radiostuff9/rca_books.jpg

Barker and Williamson Coil Mounting Barï¿½ï¿½..$15 plus shipping
http://members.cox.net/radiostuff9/bwcoilbar.jpg
http://members.cox.net/radiostuff9/bwcoilbar2.jpg

Eimac 450TH/VT-108 Transmitting Tube - $150 plus shipping
http://members.cox.net/radiostuff9/450th2.jpg
http://members.cox.net/radiostuff9/450th.jpg

Triplett VTVMï¿½ï¿½ï¿½..$40 plus shipping
Works but needs to be calibrated. Good cosmetic condition.
http://members.cox.net/radiostuff9/triplettvtvm.jpg
http://members.cox.net/radiostuff9/triplettvtvm2.jpg
http://members.cox.net/radiostuff9/triplettvtvm3.jpg

HAL Computer RTTY Interface CRI-200....$75 plus shipping
Older HAL unit in excellent cosmetic and working condition. No
documentation but it can still be obtained from HAL.
http://members.cox.net/radiostuff9/hal_cri200.jpg
http://members.cox.net/radiostuff9/hal_cri2002.jpg

You can check my user ID "n7rk" on Eb*y
for a reference as to dealing with me.

Thanks for looking and 73,

RIPOFF ALERT!

# 4135. Re: VTVM Probes - found

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-25 22:26:56 UTC
From: Uncle Peter <radioconnectionNO@cox.netSPAM>
Message-ID: <QkpKa.22116$pH3.15843@news2.east.cox.net>
Source record: 31459

On some VTVMs folks added the 1-meg resistor internally so it
was in the circuit in the DC volts mode. It works, but it defeats
the main feature of the 1-meg resistance at the probe, being able
to meter RF circuits without detuning them. Using the probe you
uncovered, it's possible to add a 320k resistor internally, and have
the best of both worlds.

Well, the case by itself should be pretty light. Packing would not be much
of an issue, since all the heavy parts (not that many in this ac/dc unit)
would be gone, including the chassis itself.

Make me an offer I can't refuse....

I have a Heathkit Warrior HA-10
1 KW amplifier in very good condition
and also a Heathkit Mohawk RX-1 receiver in very good condition and
also a Heathkit DX-40 transmitter in good
condition
and last but not least a Heathkit VF-1 VFO.
All of this radio equipment was in operation up until about 5 years ago
until a death occured at which time it was put in the closet.
I need a GENERAL idea to this equipments value.
I sure don't like to use E-bay on items this nice!
Please e-mail me any replys and thank you in advance.

# 4147. FA: Rare - HBR-16 Receiver on Ebay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-26 03:57:44 UTC
From: GS <greatsurplus@hotmail.com>

Source record: 31470
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3032562637

(My apologies to Kees and the rest of the HBR gang - I'm selling off
my entire rig collection via Ebay due to a 'change of life' - for the good -
and I need all the extra cash I can get. So please - forgive me
using Ebay on this old gem. If money weren't an issue it would have
been offered to the 'gang' - but my circumstances require I get top dollar
for all the stuff I'm selling)

For auction:

An original WORKING HBR-16 with Eddystone dial - looks just like
the one on QST June 1961 built by designer Ted Crosby. Expertly
built by W6SBC, Richard Battle back in the early 1960's. Actually,
this would be an HBR-14 - the number denotes tubes. The extra
2 tubes from the 14 to the 16 meant noise blanker and some other
feature I don't recall offhand.

Includes 6 empty coil forms - enough for 2 more bands. Comes with
numerous magazine articles covering the HBR receivers, with all
the coil data for other bands. It is now coiled up for 40 meters and
yes, it works. Beautiful sound. Granted, that was last summer when
I last used it - but I give my word it works, and if it doesn't when you
get it ship it back for a full refund.

Here's your chance - if you don't know what an HBR is, this link isn't
for you. Please hold your flames. But if you DO know what an HBR
receiver is, you'll likely not see another for sale for some time to come.

Thanks for looking - I want this to go to a GOOD home.

Dave Ellison WB7AWK
Great Surplus

# 4148. FA: Matching homebrew transmitter for HBR-16 Receiver

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3032567098

This is a matching transmitter to the HBR-16 receiver I have for
sale in another auction.

Uncanny match - almost the EXACT SAME case and 'style' but by
different builders. Built like a TANK. Amazing construction quality.
Power supply is internal with removable power cord (included).

I believe it's set up for 40 meters - via plug in tank coil. 5 tubes,
including
rectifier - 6146 final. I believe it requires external VFO. NOT crystal
controllable as it sits - oddly there is no 'xtal / vfo' switch and no xtal
sockets.
There's a BNC on the back I presume to be VFO injection. Maybe uses
a heterodyne input from a receiver IF for transceive.

I have no data on this rig at all, and I've never powered it up. I found it
in
an antique store in 1996 and saw it as a natural match for my HBR-16,
and when I put the two together it looked like they came from the same
shop!

Anyway, this is a great old homebrew transmitter - well worth the effort to
trace the circuit and see what makes it tick.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3032569332

Includes original manual and old ad from QST. Works perfectly.
Use with virtually ANY old transmitter - just plug into the crystal
socket. Also can be a QRP transmitter with an appropriate tank
circuit! Very good condition.

Thanks for looking

# 4150. FA: Vibroplex carrying case

OK, it is yours. I will get a bubble mailing envelope tomorrow and
find out what the postage is to the USA. Will let you know on your
non-group address. Miki VE7AFN.

# 4153. Bomb Shelter ham shack ideas sought....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-26 06:10:41 UTC
From: Alan <abs@hotmail.com>
Message-ID: <b9ebdf2fb8226800c2d943e19791679e@news.meganetnews.com>
Source record: 31476

Hi all!

My significant other and I (soon to be hitched for the second,
and hopefully FINAL time each) just bought our 'dream house'.

And guess what - it has a BOMB SHELTER! The house sits
on a HUGE lot (well, huge for here - just under an acre, but we're
almost urban here and most lots are 5000 sq. feet - an acre in
my town is about like Central Park!!).

The bomb shelter is built into a hillside on 'the back 40' and is solid
concrete, 8 inches thick, and all underground. It's about 16 x 25
feet with an 8 foot curved ceiling and it's MINE MINE MINE!!!! Already
told the wife and kids it's MINE. Granted, it's a dump right now,
but after I fix it up it will be the ultimate 'man room'. The entry in
the side of the hill says 'Shelter Ford - 1961' - referring to the
family name who built the bunker the year I was born - engraved into
the concrete over the hillside entry to the 'tomb'.

I'm currently selling off tons of my boatanchor collection - but I need
to decide what to keep for the 'bunker' - I'm thinking the R388 and
the DX100, plus a few smaller rigs - Drake 2NT & 2B, and a few
others.

But have some fun - what would be YOUR ultimate 'bomb shelter rig'?

How would YOU finish out a room such as I am so lucky now to have?
I plan to cut in a skylight - how silly is that? A skylight in a bomb
shelter!
and put in a wood stove - all after a new slab and carpet and all that.

I want to field lots of ideas, and I'll try to incoroporate some when I do
the big remodel - I'd love to hear what others might do!

Which channel is he on?

I haven't found mention of him on the XM web site. I've found the listings
for what seems to be the righty-talk channel and he's not in the schedule
contained therein.

I surfed for quite a while and found many, many messages saying that
Limbaugh is NOT on XM, and only one that said he is. No details were given.

# 4164. QST cancel the "right" of Equifax to reveal your credit to EVERYONE

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-26 21:07:04 UTC
From: Richard Clark <kb7qhc@attbi.com>
Message-ID: <8bnmfvg2d1mhbcuvc9pligeouq2cbhcofc@4ax.com>
Source record: 31487
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.space

Act before July 1st to preserve your privacy.

Hi All,

Subject: Your Credit: Personal Information goes public

Starting July 1st, 2003, the four major credit bureaus in the US (Equifax,etc) will be allowed to release credit info, mailing addresses, phone numbers, etc., to ANYONE who requests it. If you do not want to be included in this release of your personal information,

you can call 1-888-567-8688.

Once the message starts
you will want option #2 - wait for the long silence to offer it!!!!!
(even though option #1 refers to this email, push #2)

Be sure to listen closely, the first option is only for a two-year period.

Make sure you wait until they prompt for the option which opts you out FOREVER.

PRACTICE this call at least once to hear the whole ball of wax through. The message menuing is designed to obscure your options and to muddy the water in their favor. It is heavily designed so that you take the first less protective path (note, they approach this with your ignorance giving them everything). Nothing will happen until you are prompted to speak your name, and punch in your street address to put the gears into place. PRACTICE this call to that point until you are satisfied.

You should receive their paperwork in the mail confirming the "opting out" in less than one week after making the call.

Then write your congresspeople and thank them for entitling these agencies to stream your private information to ANYONE (not just creditors).

73's
Richard Clark, KB7QHC

# 4165. Hallicrafters S19R Sky Buddy

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-26 21:34:54 UTC
From: Opara Kvijji <me@there.com>
Message-ID: <JRJKa.6063$OE2.721843@news20.bellglobal.com>
Source record: 31489

I have an opportunity to buy an S19R Sky Buddy by Hallicrafters. I understand they were built in the late '30's, early '40's. This one has the speaker replaced with a slightly smaller speaker, but sounds fine and the rectifier circuit modded to use a 5Y4. Many new caps (filters, for sure) have been replaced. I don't really care what they are worth, but I'd like to hear people's opinions and experiences with this model (It's the early one with a slide switch for standby, not a toggle switch) My main reason for buying it is that it sounds better and is safer to use than my current S38C AC-DC series set. (Which I still love, BTW!!)
Thanks!

>SNIP<

Hi, Richard. Please make snopes.com a regular part of your reading day. Here's a particular URL:
http://www.snopes.com/inboxer/pending/credit.htm
with a particular quote:
Claim: The four major U.S. credit bureaus will be allowed to share your private information with anyone who requests it as of 1 July 2003 unless you specifically request them not to.

Status: False.

Example: [Collected on the Internet, 2001]

Just wanted to let everyone know who hasn't already heard, the four major credit bureaus in the US. will be allowed, starting July 1, to release your credit info, mailing addresses, phone numbers etc. to anyone who requests it. If you would like to 'opt out' of this release of info, you can call 1-888-567-8688. It only takes a couple of minutes to do, and you can take care of anyone else in the household while making only one call, you'll just need to know their social security number. Be sure to listen closely, the first opt out is only for two years, make sure you wait until they prompt you to press '3' on your keypad to opt out for good.

Origins:
...
However, it is not true that consumers must call this number before 1 July 2003, nor is it true that recent legislation allows credit bureaus to share private information with "anyone who requests it." This misinformation has been circulating since 2001, and the same message keeps getting get dusted off and sent around every year with an updated deadline. (In fact, if you call the number listed above, the first option you're presented is to listen to a message explaining why the e-mail quoted above is false.)

The entire page explains what the problem is and how the hoax keeps getting sent around. By the way, have you sent your business card to that poor boy in England who wants to have the biggest collection before he dies of a brain tumor? :-)

This auction is for the entire package listed below. All are functional, and in very good condition. The EAC R390A is CCA Excellent condition, the cabinet (Stromberg-Carlson) is

in fair condition, with shock mounts. This package consists of:

CENTRAL ELECTRONICS EQUIPMENT:

4- 20A transmitters, working fine, w/cabinets

1- 20A transmitter, working fine, rack mount, in Hallicrafters cabinet

3- BC-458 vfo units, 2 working, one not.

2- MM-2 analyzers, not working.

1-20A cabinet, excellent

Boxes of spare 20A parts.

And 1-EAC R390A with cabinet and shock mounts. (cabinet is fair, should be repainted. R390A is excellent.)

MORE IMAGES AVAILABLE AT: WWW.W1CNY.COM

Would prefer a pick-up, as I have a very bad back.

Packing and shipping by UPS will be expensive for good solid insured packing and

shipping. If you have a UPS shipper's account, please let me know.

I will ship to USA and CANADA.

I will deliver within 100 miles of Hartford CT. Or an arrangement can be made

for a pick-up.

Payment by money order or PayPal (no credit cards), or if I deliver them, cash.

This a single used EIMAC 8877 tube which has been tested and gives full output mounted in an amplifier sub-chassis. The price includes two genuine EIMAC SK-2216 air system sockets, but one chimney piece is missing. Only one Plate cap comes with the unit. The chassis unit contains a Collins Filament transformer No. 672-0072-00 (115V AC tapped input and 5 Volt AC at 20 Amps out to run the pair of 8877s) This is a serious high power sub chassis ready for someone to build it into an HF amplifier.

This fact is NOT a fact at all.

There is NO explanation at all. the FIRST option is, just I
described, an offer to allow you to withdraw for 2 years.

The SECOND option comes after some great length of dead air, long
enough to give every appearance of the first being the ONLY option.
The operator (a mechanical voice actually) zips through this quickly
to then offer:

The THIRD option is for you to RESCIND your opt-out, or to SIGN UP for
this benefit! It comes expressed in language tailored for your choice
over the quick skim of the second option.

It is quite obvious that if one were to follow the instructions, now
perpetuated by you, at the page you offer without regard to what was
being said, the individual would be blowing off their privacy. HENCE
my caution about LISTENing closely and doing it more than once!

Industry shills are working overtime, and I can see the makings of an
Option Roulette being played to good advantage - even here.

forgive me for the lack of a warm closing, you don't seem to have a
call, and you certainly don't have the facts nor the experience.

Hi

This is way off-topic, but an interesting controversy.
.
I checked the "Equifax" site at http://www.equifax.com
at the left hand side, click on FCRA (Fair Credit Reporting Act),
at bottom of page is the "opt out" info, with the phone number
that Richard included. There is +No+ deadline reported,
but the opt out will remove your name from any lists
that may be sold by the credit bureaus for purposes of pre-approved
credit offers, and (presumably) other third party junk mail offers,
so is useful to do.

73,
Ed k4pf

Makes no difference. There are only 2 styles of knobs on this set - small
and large. They are identical to the S-38 series. Any of the small knobs
fit the "BFO" (pitch" shaft.

If you're sure that most caps have been replaced, it means a radio you can just
use and enjoy.

Are you trying to figure out how much to offer for this set? I wouldn't hazard
a guess.
I have an S-20 (non-R) and it's a fine little fun radio. The S-19R has
bandspread (not calibrated) and no RF stage, but at least it has a real BFO
tube, unlike your S38.

But you might hold out for an S-20R -- they are common and a better radio (RF
stage), though they lack that classy open silver dial. The S-20 (non-R) has
such a dial, but there may be harder to find (Want mine?) 73, Mike K.

Oscar loves trash, but hates Spam! Delete him to reply to me.

I'd agree with those who suggest looking for an S-20 or S-20R. If the vintage isn't too important, you might also keep your eyes open for an S-40, S-40A, S-40B or S-85, which are post-WW II receivers. Also, you could consider National receivers, e.g. NC-57, NC-88. The major advantages of these models are that they have an RF stage, thus reducing image response and I think a second intermediate amplifier stage. Just some food for thought.

I don't doubt that many fraudsters hang out on ebay, but I have done OK so far. I usually check the seller's feedback rating before bidding, but on the one occasion I forgot and discovered later that the seller had a Zero rating (i.e., this was his first offering on ebay -- or the first using that ID), everything was fine.

The closest I came to getting burned was on a $500 item, but the seller's local police dept. got in touch with me before I had gotten round to starting any serious investigation of my own; I got all my money back. Even then, it may have been stupidity rather than criminal intent on the seller's part: he offered for sale items that he did not yet have in stock, and then found that he could not get them.

Hi,

No more of a breeding ground then the local hamfests, swap meets or local
newpapers
qth.com, eham.net arrl.org etc...

If I get taken at the local hamfest, you will never know about it, on Ebay
everyone hears
about a scam from the usenet.

It is easy to get caught up in auction 'excitement' and the thrill of
'winning'
we have to remember it is a purchase (or sale) just like buying a car or
ordering dinner out.

Feedback is the key, I have dealt with many new ebayers, even I was a new
ebay guy.
my first deal was a purchase for $ 400 from an established seller with 100 %
feedbacks.

Just ask a lot of questions on the items you want to buy, if you don't like
the answers, just pass it up.

Nice thing, if the item is not sold it can be relisted and you can get
another chance or
another seller will have what you want.

Did I tell you about the time that used car dealer sold me that car that was
driven by his mother ?

# 4191. FS: Drake TR7/PS7/RV7 + more $650 + shipping

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-06-27 16:11:16 UTC
From: antswitch@tomochka.com
Message-ID: <47c89a30.0306270811.afd6d77@posting.google.com>
Source record: 31364

More shack cleaning. Willing to part with the trusty TR7/PS7/RV7 and accessories as described below for $650 + actual shipping, no packaging fee, by carrier of your choice.

Works perfectly, 160W+ on the lower bands 100+ on the high bands, built for a CW op (you can easily swap the narrow filters for broad ones if you use it for SSB). True blue lamp filters. Couple small (1/4") scratches on face, so have to give it an honest 8/10 for cosmetics. The PS7 needs paint on top, so 7/10 (stick it under the desk). Selling all as a package here first, on eBay if no takers, will not break up. You can sell off the parts yourself.

TR7 (s/n avail. on request)
non-sticky black finish, DR7 readout
General coverage xmit/rcv (trace cut mod at factory, no AUX-7)
NB-7
Filters: 1.8, 1.0, .5, .2 KHz
24 VDC fan (very quiet), have original FA-7 cover
Original manual
Original box

PS7 - what can I say, works FB. Comes also with 24 VDC fan and FA-7 cover.

RV7 - refurb'd PTO, smooth as silk, 9.5/10 face, no scratches. PTO in TR7 is fine, just wanted to work split.

MISC - New set of non-factory TR7 extender boards, misc. TR7 circuit boards (from working TR7 whose case was damaged), TR7 service manual copy

Thanks for reading.

73,

Casey, KS7J

Here Richard will this help you to understand??

CREDIT REPORTING INDUSTRY ONCE AGAIN WARNS CONSUMERS ABOUT FALSE E-MAIL

Atlanta, April 16, 2003 Consumers are once again being advised by the credit reporting industry to be wary of a false e-mail circulating the Internet regarding the information handling practices of consumer credit reporting companies.

The false e-mail reads:

"Just wanted to let everyone know who hasn't already heard, the four major credit bureaus in the U.S. will be allowed, starting July 1, to release your credit info, mailing addresses, phone numbers... to anyone who requests it. If you would like to "opt out" of this release of info., you can call 1-888-567-8688. It only takes a couple of minutes to do, and you can take care of anyone else in the household while making only one call, you'll just need their social security number."

Contrary to claims made in the e-mail, credit-reporting companies do not provide personal consumer data to "anyone who requests it." Federal law prohibits such a practice. Consumer credit reports are only provided to legitimate businesses that have a permissible purpose under the law. Such permissible purposes typically involve the extension of credit, insurance, employment, or government benefit.

The toll-free number included in the e-mail is valid only for consumers who want to remove their names from mailing lists for pre-approved offers of credit lawfully generated by the major credit reporting companies. That opt-out number has been in effect and available to consumers since 1997.

The Consumer Data Industry Association issued three previous news releases noting the e-mail was false and misleading. Consumers can access the original release sent out in July of 2001 by clicking on "Media Room" at www.cdiaonline.org. The Federal Trade Commission (FTC) also issued a consumer alert in 2001 when this message first circulated to advise consumers.

--Source: Consumer Data Industry Association, April 9, 2003

And here is the link from where this info came from
http://www.equifax.com/corp/pressroom/pressreleases/2003/2003_04_16.shtml

Good luck too on getting all that money from Nigerian nephew of the former President that only required your bank acount number.

I saw your law reference library, bucko. A website devoted to "Urban
Myths" - impressive stuff to base your practice against.

I see the quality of your "Legal Assistance on the Web" and note you
have actually done nothing but bait the trap to snare the unwary, ripe
for unscrupulous Credit Bureau practices.

In actuality, your credit records pretty much _are_ available to everyone.
It might be illegal to look them up or to use them, but it happens all the
time, to the point where one company I can think of does a credit check on
potential employees. Just because it's illegal doesn't mean that it does
not happen regularly.

PICK UP ONLY - Tacoma Washington

I bought this beam and rotator several years ago, and
fully planned to install it. I just never got around to it and
I'm tired of looking at it. All traps are there and good -
includes a set of new bushings that I bought somewhere
so it would be 'new' when I put it up. 20 - 15 - 10 meter
operation. This is the full size TA-33 - not the Junior.
Rotator is a 5-wire CDE with controller. Come and take
a look - you can tell more by looking. Rotator has been
stored in the house.

$125 cash takes it all away - email if interested and I'll
arrange for you to come see. I won't break the two
out separately, so please don't ask :-)

Off camping for Saturday / Sunday but will check email
all day Friday and on Sunday night when I get home.

Thanks!

again - PICKUP ONLY - not heavy - just cumbersome

# 4207. FS: HUGE number of CQ, 73, Ham Radio, QST magazines - 40's and up

LOCAL PICKUP ONLY - Tacoma, WA

Shipping would be insane - these weigh a ton!

HUGE lot of QST, CQ, 73, QST, Ham Radio and other radio magazines. MANY from tube era - 40s, 50s, 60s, and into the 70s. Very few 'modern' issues - mostly relating to tube rigs. These fill up 5 book shelves in my radio room. Not sorted by year, and I'm not planning on doing that. Some are nice, some are ratty, all are fun to read - great old photos of old rigs and parts and gear and such. LOTS of magazines here.

I'd like $75 for the lot - email to come see.

I'll be off camping Saturday and Sunday - checking email Friday and when I get back.

Thanks!

:-> Whoa, Dick! You are on a _rant_!

The URL again is http://www.snopes.com/inboxer/pending/credit.htm
and I have nothing to do with snopes.com -- it's an excellent resource for
reading about hoaxes such as the false claim that credit bureaus can sell
all our private information unless we opt out. In fact, the Fair Credit
Reporting Act of 1997 contains limitations on who may request the
information and for what purposes. The link I provide to snopes.com
explains it all in plain English for those not so angry they've lost the
ability to read.

And while you're (well, not you, Dick, but the other readers) at
snopes.com, browse around and read about the online myths that a tooth
left in Coke will dissolve overnight, the _true_ story of a medical student
who discovers that an anatomy class cadaver is the body of his relative,
the unfortunate hoaxes about children sick with cancer who will receive
money/accolades/fame for every business card/email/birthday card/whatever
that is sent to someone who is now being buried by unwanted mail or
email. And be sure to search snopes.com for ManBeef. Or maybe not.

I also invite one and all to drop by my Website at
http://www.PhilipStripling.com/
and see if I've baited the trap for the unwary. :-> I'm sorry to tell you
(well, not you, Dick, but you know that already) that it's not nearly as
entertaining as snopes.com, but who knows you (er...) might find something
interesting or educational.

Buh-bye, Dick. I'm sorry you're so freaked out over being led astray by the
email hoax. You're not alone, though.

73, Dick!
Your pal,
Phil

>

The large knobs on the first generation S-38s had inset nickel plated brass rings.

The BFO knob is unique to the BFO (pitch) control. The BFO shaft is a threaded screw, about 3/16" in diameter. The knob's setscrew doesn't get a good permanent bite into the BFO shaft and tends to loosen up. There are a lot of missing BFO knobs out there, and they aren't always easy to find.

I've seen all sorts of different Hallicrafters knobs with the same part (or molding) numbers. Plain knobs, brass ring knobs, knobs with the stainless steel cone insert and knobs with one or two setscrews all have the same number.

Please folks - READ THE POST.

"Pick Up Only" means just what it says. How can
I make myself more clear :-)

Not trying to be grumpy - but I've received several emails
already asking to ship it somewhere. I don't want to!!
I'm not even sure how I could! Let's save the typing time!

Also, I'm NOT interested in trading for another beam!
Holy smokes - I never even got THIS one in the air! Also
I SAID I don't want to separate the beam and the rotor -
I am sure that's an easy one. Several emails asking THAT.

Golly, thanks for all the interest but let's all save ourselves
some email bandwidth, eh? Again - not grumpy - just
trying to save you'all some typing, that's all.

73 and cheers to all on this hot NW (TACOMA WA) summer
day. In Tacoma. Near Seattle. Northwest Washington State.

<grin>

> PICK UP ONLY - Tacoma Washington

Steve,
Just a bit of advice: A mod tranny from an ART*-13 will work very well in your B&W 5100. The original type was a bit sub standard. If you buy a used one load your transmitter conservatively and try not to push too much audio through it. t'll make 100 percent modulation without any additional modifications.

I've personally zorched '5100 mod iron before and know the feeling. Peter Dahl sells a replacement for it but it's very pricey.

Good luck and hope to hear you on the air sometime when you have it going.

UPDATE

Guys, it seems I may be eating crow, but after two weeks I have
received my radio. Let it be known right now that nobody is more
shocked than I. While this situation does have a happy ending, heed
these warnings which are good for both buyers and sellers, which I

have learned (and should have noticed):

1) Always search someone's history before engaging in a transaction. I'm net-savy, and even I didn't think to do this. What was I thinking? A five minute search would have saved me many sleepless nights.

2) Moneygrams just feel "seedy". At least I didn't send a moneygram, but given that I was asked to send it in the name of a "rush account", it should have screamed to me "this will be difficult, if not impossible, to trace!"

3) Money orders do -not- protect the buyer. You can file a claim with the postal inspection service, but unless you lost thousands, your claim will sit in a file.

4) Be weary when addresses you're told don't match what's listed on QRZ.com, or other online references.

5) "Recall of Mail" forms are not guaranteed to work. This is a form you can fill out at the post office in hopes of having mail you sent returned to you.

6) Getting your money from someone is expensive, if not prohibitive, to do on your own. Had I wanted to pursue Dale, I would have had to hire a lawyer and fly to Hawaii to go to court.

I'm sure there are other lessons as well that will sink in as time goes by. But even though my situation worked out, I look back and see many, many signs that should have kept me from sending any money in the first place. I was stupid (some will say I still am, just not quite as much) :)

For now, I'm glad the nightmare is over. -Gary

ps. if anyone has questions or comments regarding my situation, feel free to e-mail me directly in addition to the group, as I don't always hit the newsgroups often.

Two weeks??? How did you have it sent? USPS and UPS ground could very
easily take that long from HI to the mainland. I've seen UPS ground take
7-8 days from Oklahoma to Washington..

If you look at any of the "Next Day" or "Second Day" services, you
will note that that number of days is only guaranteed for certain
areas. If either end of the transaction is outside those areas, it
will take longer.

Ground service will of course take even longer.

All:

As someone living in Hawaii, I can tell you that most of your estimates on shipping time to the islands is way too short. Shipments to the mainland do fare better, but you really have to take some of the estimates with a grain of salt, especially if you are asking the guy at UPS or at the Postal Office....

As an example, from the mainland, the USPS will tell you that standard parcel post takes 5-7 days, while in reality, a package of any size (like larger than an envelope) will take three to six WEEKS. So far, the average time for a package sent via first class parcel post from mainland to Hawaii has been on the long side of 3 1/2 weeks. Sending similar sized packages from Hawaii to the mainland typically is a little quicker, but my average is a bit over two weeks to the west coast. (I don't use this method any more, so it may be much worse now.)

I prefer USPS Priority Mail to the mainland, it gets to just about anywhere on the mainland within 5 to 7 days, and Express mail is typically guaranteed to make it in two days (though I tend to get postage refunds for about half of the shipments sent Express because they seem to take three or 4 days. Generally, if the Express Mail charge is over $40 or so (not including insurance) they make it in two days, but if it's below that figure, it takes three or four days...).

UPS and FedEx Overnight from Hawaiian Islands (except, perhaps Oahu) is a minimum of two days. Same for Overnight shipments to Hawaii. For some reason, Airborne Express has managed to get something to me on the Big Island of Hawaii overnight from Texas twice in the past three years. I'm not sure how they did it, or what it cost, but it is an additional data point.

Even though there is no ground between Hawaii and the Mainland, we can ship UPS ground from here (though at higher rates than you'd expect). The "ground" packages get space available on their cargo aircraft to a terminal on the Mainland (in California if I remember right), then go ground to their ultimate destination. Thus, you could get really lucky and receive a ground package from HI to your location in as little as 7 to 10 days, but a more normal arrival time would be on the order of two to three weeks.....

Good Luck!
--Rick AH7H

Source record: 31402

I have 2 items: Kantronics signal enforcer ( audio filter for ssb & cw plus rtty. It's just called the signal enforcer. This unit is a state of the art from 1980's before dsp. Datong had a similar product called the FL 3. Sold for nearly $180 or perhaps $229, can't remember. I am looking for a manual or source for manual. If QST did a product review I will be able to obtain that information. The second Kantronics item is the Field Day 2. This item displays characters of cw & rtty. Among other things it's a code reader. I believe this unit was expensive, perhaps $300 plus dollars when new. Front panel controls are reset, speed,editor,space and power. Rear panel demod out, rcvr in, key input and what looks like a reset button marked as rtty/code. In addition, one phones jack and one 1/8 jack not labeled. Thanks for any help with this Kantronics gear. Phil

Pictures at:
http://mywebpages.comcast.net/mnowlen/urm-25d.jpg

Military AN/URM-25D Signal Generator, 10 kHz to 50 MHz Tunes
Continuously in 8 Bands

Perfect match for your R-390 or ANY other radio operating over the
frequency range.

SPECIFICATIONS:
Frequency Range - 10 kilocycles to 50, 000 kilocycles ï¿½ .5%; ï¿½
.05% from 1 mc to 50 mc when calibrated against integral crystal.

Tuning Bands And Range Of Each Band--
(1) Band A --10 to 27 kc
(2) Band B 27 to 80 kc
(3) Band C-80 to 230 kc
(4) Band D 230 to 680 kc
(5) Band E -.68 to 2 mc
(6) Band F 2 to 8.3. mc
(7) Band G 8.3 to 18 mc
(8) Band H -18 to 50 mc

Output Voltage (RF) 0.1 to 100,000 microvolts continuously variable
(across a 53.5 ohm external load).

Types Of Modulation:
Amplitude modulation -0 to 80%, (indicated accuracy within +10%).
Internal modulation frequencies: 400 or 1000 cycles per second + 5%.
External modulation frequency: 100 to 15,000 cycles per second.

Power: 103 to 126 volts, 50 to 1000 cycles, single phase AC.

In very good condition, checked, all bands working to full output.

Includes copies of TM 11-5551B URM-25B Full Maintenance Manual and TM
11-6625-278-20P URM-25D Supplement.

$125 + Actual Shipping Cost (No Packing Charges)
Send Zip code for shipping costs.

Ebay is safe if you check your seller first. If he has negative
feedback check 'who and why'.I've had no problems with Buyers - "I gets
my money I ships." My only complaint is the number of "tire kickers" who
ask time consuming questions with no intention of bidding. But that
happens in stores too you just have to grin and bear it.

Seeing as how he has no known address or domain name other than posting with
"newsdawg" and comcast of PA, the scam is probably Robert Morein himself.
His claims may be libelous and unfounded which is reason for a lawsuit.
Let's keep and eye out for this header information, which he can't change
even though he is not posting a name or address for return.

Its one thing to get screwed by a guy who you're looking in the eye and
probably doesn't live that far from your QTH than it is by some BS artist
the lives 3000 miles away, of whom your only recourse is to flame him on
Ebay or the NG's.

# 4247. Swap for Collins or Ten Tec Station

Hi,
A pending move makes the following available:

Hallicrafters HT-32A.....$250
HT-37 ......$175
HT-45 Loudenboomer(extra 3-400Z)
complete with original power supply
& cables & relays...$500
SX-101A....$225
Will also sell as a package for $950 obo.
Everything was in working order when last used. These
were working when stored. They are cosmetically nice
in my opinion and can be restored to excellent.
I have some jpegs available. Pick-up only in Travelers Rest near
Greenville, SC. 864-834-7848

>My friend called his credit card company and stopped payment.Pay pal
>emailed him and told him that is not the way to get his money back

Actually, that _is_ the way to get his money back, but PayPal would prefer their customers not go directly to the credit card company because if the credit card company agrees with the claim then PayPal is out the bucks since technically PayPal is the selling merchant, at least as far as the credit card transaction is concerned. Instead, PayPal would rather you give up your rights as a consumer and let them 'arbitrate' the dispute... meanwhile 30 days elapses and you lose your right to dispute the charge with the credit card company. They have no legal right to force you to do this but I'm told that if you do they may threaten to drop you as a customer.

This the original Motorola Red Book published by Sherman Wolf in 11" x 17" format. While not exactly a rare book, it has become quite difficult to find in the past few years.

It's a great 136 page compendium of schematics, crystal information and alignment information covering Motorola commercial two way radio equipment from the old 30D to the early Motracs. Much of the information can no longer be found from any other source. This one is in great shape.

$20 plus shipping

I am monitoring 10m right now and am noticing something about my rig. I have an htx 10 that seems to have a ground problem. I do not have the dipole grounded. nor is the radio but when I touch the mic cord the squelch clears up and I can hear much better. Is this a grounding problem and if so, what is the best way to ground it? Sometimes when the mike gets closer to the radio it clears up too.

I am not transmitting, just monitoring

I have a superb condition Kenwood TS-850S/AT with a narrow SSB filter and a narrow CW filter installed. Includes original mic, manual, box. 100% operationally and beautiful cosmetic condition.

I would like to trade this radio for a vintage AM transmitter/receiver combination. Please note I do not want any junk and I am going to be sure to get equal value for my transceiver. I am looking for a fully functional station in great condition. I do not want any Heathkit equipment (already have it). Would prefer a Johnson Ranger/Hammarlund or Hallicrafters combination or something similar.

Any interest?

Cal Barton

|Is a series automatic noise limiter supposed to be superior to the
|parallel type? If so, why?

In the series limiter, the diodes are normally forward biased into conduction and the audio signal passes through them. When a noise spike occurs, it drives the diodes out of conduction and the signal path becomes a high impedance. For best attenuation then, the source and load impedances need to be relatively low.

The converse is true for the shunt limiter. Here the diodes are reversed biased and in shunt with the signal path. A noise spike forward biases the diodes into conduction thus shunting the path to ground. For best attenuation, the source impedance needs to be relatively high.

An "automatic" limiter only works when there is a carrier from which to develop the bias for the diodes. Typically a long time constant filter strips off any modulation and provides a DC signal proportional to the average carrier level. Noise spikes exceeding this level then operate the limiter.

So, the answer is: it depends. With semiconductor diodes, IMHO there is some advantage to the series limiter since the bias can be set such that the limiting threshold is lower than that of a parallel diode, which has its intrisic 0.6 ~ 0.7 forward voltage threshold.

With vacuum tubes, signal levels tend to be higher and any advantage of one over the other is in the eye of the beholder. Again, MHO.

Message-ID: <f3d277fb.0307010516.3bc3b591@posting.google.com>
Source record: 31299

Group,
I found a cargo container of these "OLD" Mil Aircraft antenna tuners.
I bought 3 truck loads of other old tube gear from these folks but
passed on these tuners.
No body knows what they tuned. TRAILING WIRE? I think they are MF/HF.
Inside are 2 vario-ductors or (vario-couplers),
fixed caps, lots of HV ceramic switches. Coils are old cloth litz wire
on bakelite/fiber core forms.
They are extreemly lightweight for their size. Transmitter Tuning Unit
TU-10-B

Can these be used for anything worthwhile or just junk?
Maybe too narrow banded for Amateur use?

Maybe a veteran or aircraft radio buff recognizes these.

Here are 3 of them->
http://pic3.picturetrail.com/VOL18/68355/167687/28486943.jpg

I took a sample unit apart to inspect.
I have to buy the whole container or pass.
They are kind of neat, but that is a lot of tuners to get stuck with.
Even at $2.50 ea prox.

Thanks for reading,
John

From: jimmoci@aol.com
Message-ID: <20030701101755.02065.00001538@mb-m07.aol.com>
Source record: 31301

All rohn stuff is new, never installed. Some was stored outside. galvanizing may be a little dull, but none of it was ever used.

25AG4 flat top set up to be used with thrust bearing $75

Tilt over tower base section, gets set in when you pour your concrete. $75

ROHN peaked or flat roof mount- $40

ROHN drive rods and base- great for field day and temporary set-ups. $40

BPC25G flat mount for concrete pad. $40

Paypal and money orders ok, pick up only near Phila., PA on the large stuff. Small bases can be shipped fed-ex ground.

Will be @ wilkes barre hamfest with a few used rohn parts also. Mostly takedown stuff still in good shape.
Thanks!
Jim

These are tuning units that plug into the front of the
BC-375 and BC-191 transmitters from WW-II. You may get a very
modest amount for them if you parcel them out on Ebay over time.
It wouldn't take much to "flood the market," as the TU-10-B is common
and most interested collectors already have one (see exceptions below).
If you have any that are still in the original box,
they have more value. The cases in which the tuning units are housed
may bring a few bucks, since many collectors are missing cases.
I hate to see any WWII relic go begging,
but these are "give away" fodder even at $2.50 each.

There are, however, exceptions. If any of the units are marked with
a model number other than "TU-10-B" and/or have contract dates
on the nomenclature plate that predate WWII,
or are otherwise unique in some way,
they are of interest to more advanced collectors.
For example, a TU-AA-10 or a TU-10-A with
contract date in the 1930s would be very attractive.

Does the container only hold TU-10s?
There are units marked from TU-1 to TU-4 (rare and valuable)
and TU-5 to TU-10 (same conditions as above).
If you will post any unusual models or features,
I can provide more information.
Regards,
Dave S.

At URL:
http://hereford.ampr.org/millist/m25.html

Sez the TU-10B was Tuning unit, 10-12.5 MHz, For BC-191 and BC-375.

At this URL you can get details of the BC-191 and BC-375

In US Navy, we flew R7V-1 (C-121 & EC-121) Super Constellations and we had a similar unit -- for the ART-13 Transmitter. The Tuning unit was used to load up the trailing wire antenna. Don't recall the Mil number for this tuner.

Worth anything -- maybe to WarBird restoration builders. Maybe try E-Bay

Hi John...

These are plug-in tuning units for the old BC-375
transmitter. They come in various frequency ranges.
I believe the ones with the variometers are for the
lower frequencies. These units are a very good source
of parts. Nice vernier dial drive, ceramic switches,
etc. At $2.50 ea they are a steal!

73, Roger

# 4288. Johnson Kilowatt Matchbox Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-01 19:50:57 UTC
From: w2nbc@optonline.net
Message-ID: <61037fe9.0307011150.7332bc97@posting.google.com>
Source record: 31309

Hi all,

Just received a Kilowatt Matchbox in good shape outside..I opened it up to find that the relay had been removed, which I understand was a common mod for transceiver operation..The problem is that a piece of RG-213U is connected to the coax input BUT the other side is just hanging inside the box..I have a schematic, and I see there were two taps on the coil, one for the receiver output, and the other for the transmitter input..QUESTION..Where is the proper tap location for the transmitter input on the coil?

Thanks in advance,
Jeff W2NBC

In 1963, I built an HBR-16 receiver with my own two hands. I knew it well.
Regardless of what you've been led to believe, the one you have for sale is
NOT an HBR-16.

As others have noted, they're the tuning elements from WW2 airborne transmitters.

Their saleability is somewhat limited, not many people collect those big somewhat-homely transmitters. I sold one a while back for around $40, but not too many of those sales would satisfy the collectors with $40 to spend.

But the units do have a bunch of parts that are very expensive to impossible to get, just the thing if one is building a high-power transmitter or antenna tuner.
There are hi-vol, hi-amp switches, wide gap capacitors, hi volt mica caps.

You could try selling them with that angle in mind..

OR on eBay there seems to be a healthy "Tesla coil" market, these parts are right up the alley of anybody crazy enough to build one of these.

Parts rig? Restoration? You decide - all here except knobs. All the tubes, and chassis is intact - has not been hacked in any way I can see. No mods, no extra holes, nice finish and silk-screens. I vote 'restoration' but you decide. No power supply. No idea if it works, but I would strongly guess it does not as it sits.

I have for sale a very nice Drake RV-75 digital VFO. This one has been gone through by The Drake Man, John Kriner, in May of 2000. At that time it was completel aligned and checked out. It has been used little since then. It comes with the original manual and cables including the RIT cable. I also have all of the paper work on the work done by The Man. This VFO works and looks great. Price is $775. Thanks, Charlie Hugg, K5MBX

Hi,

Anyone parting-out a DX-100? I've a requirement for the AF interstage transformer that goes between the modulator driver valve and the pair of 1625s. A Heath original would be nice but a suitable alternative would be OK.

Payment in US dollars no problem.

73,

Hello

Anyone know of the history between the Uniden Tempo 2020? It looks an awful lot like a Yaesu.

Also, I would like to purchase or have a scan of an ad for this radio. I believe they were sold during the mid-1970's by Henry Radio.

Thanks and 73s

Bob KT8DX

They were distributed by Henry Radio, 6146B finals, many of the same
mechanical parts, drives, pots as the Yaesu.
Built like brick outhouses, rock solid cast face plate, VFO stability, they
got bad raps from certain dealers in the States but are great radios.
You just have to clean them up, the PLL are real fussy with oxidized
contacts.
Static easily takes out the front end FET (4 pin in socket) I had one in 79,
it happened several times. You have to install a choke and 2 diodes (mod)

Well, if you have access to a cargo full of these, are there any other radio parts or units for sale by the carload? Strange buy for sure... These should be worth about $20-30 each for parts, mainly for builders. Nice in their day but not desireable now... Most collectors already have their share of these kinds of rigs. Thanks for posting. Will give you $5 each for sure.. 73 San

You don't mention what type of power supply you are using and whether IT is grounded on its negative terminal to a good earth or cold water pipe ground. I'll bet it isn't.

Yes, it does sound like grounding the radio chassis would probably clear up much of your problem. It sounds like the natural capacitance of your body is causing a ground plane or "ground counterpoise" effect.

Connect the chassis of your radio to either a ground rod via a #10 or better sized wire or to a good METAL cold water pipe ground. I'll bet your problem goes away.

The same effect in increased signal strength can be observed when using a cheap handheld shortwave radio. Hand capacitance and the ground plane effect of the human body will boost reception. Grounding the radio's chassis properly will remove the effects of body capacitance and give you the same signal to noise ration boost on receive.

I won't even begin to comment on the problems you'll avoid on transmit with a good ground to the radio's chassis.!!!

Try it!!!

# 4328. GE P-780

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-04 08:26:14 UTC
From: dxlover <dxlover@adelphia.net>
Message-ID: <GSaNa.9926$Hw.6849684@news2.news.adelphia.net>
Source record: 31250

I don't think I ever posted on my new addition, I googled and didn't find anything so I thought I'd drop a line to the group.

Thanks to Brenda Ann :-) I now have added another piece of 'radio history' to my humble collection. If any of you all are ever interested in a 'rock solid' (understatement) straight up AM radio, the GE P-780 should be your choice. You'll be glad you did.

This is a no frills BCB receiver with only a screw on the back for an external antenna and another for ground. I just cannot understand why in the world that companies don't make a radio like this anymore, I suppose it all comes down to the mighty dollar, and it wouldn't be cost efficient.

Six D cell batteries is all that powers this heavy beast up, and it truly is one heavy and durable radio. You hit someone upside the head with this and they're in trouble...lol. What surprised me was that both the selectivity AND sensitivity was better than I would have ever thought just by looking at the radio.

I took it out to the cabin and rolled out 1000ft. of wire and I just barely touched the tuning knob and I had a station with no images from another close by, but as soon as I touched the tuning again.....there was another one so close I couldn't believe I couldn't hear it on the other station. BTW, the QTH at the cabin is literally surrounded by mountains, but literally ziltch on the rf......which is splendid.

You don't need a 1000ft. of wire either for this piece to perform, that's just my M.O. out there in the middle of no where. If you see one on ebay or know of someone letting one go, grab it, you'll be glad you did.

For the ones that haven't read the link I posted for this a while back under the 'My New Addition' thread, here she is. :-)
http://www.transistor.org/feature/jutson/details.html

**I'll add, I've had the GE Super Radio1/2 and they are toys compared to this, IMO. The sound is 'incredible.'

Source record: 31251

I've got three of these beasts. One is absolutely perfect in appearance (but doesn't work naturally), one is parts only, and one I use every day. The receiver is nice and quiet and sensitive. Non of the "hash" or other noisy junk that seem to come out of more modern rigs. I use mine with an old D-104 Crystal mike and get nice audio reports. The one I use had a bad carrier pot, so I replaced it with one from the "junk" rig. The insides look and feel like Yaesu, but I cannot find markings anywhere like the little "Y" that Yaesu likes to stencil on things. I wrote to Uniden, and they send me sales literature for their Uniden 2020 Satellite TV receiver!

Do you have any information on the choke and 2-diode mod? Perhaps there is a website out there with this info?

WHERE ARE ALL THE TOUGH GUYS IN THIS SHORTWAVE NEWSGROUP?

Where are all the tough guys in this shortwave newsgroup like GrtPumpkin32 (Linus), RHF, Bball, N8KDV(Steve), Starman, Phil, Frank Dresser, Dan Conti, Tad Early, Tasd Early, Red October90, Brian Denley, DeWayne, Al Patrick, Agent Smith, Burr, Mike Maghakian, Paul, Joe Strain, bpnjensen (Bruce Jensen), Diver4777, Radioman390, Eric F. Richards, R274C, Hfguy, DougSlug, RFCOMMSYS, Signalchaser, Robert, MJC , Dxlover, Elfa , J Tabor, Telamon, Dxing since 1957, Michael Moore, Mark Keith, Radioguy and the rest of the regular contributors of this shortwave newsgroup. "I THOUGHT ALL OF YOU ARE MACHO MEN", What happened? Perhaps your all R.I.P. (Rest In Peace) dominated by the intellectual gays and politics groups.
Perhaps all of you are hiding at the back of your wives because you cannot fight back against the infiltrators like the gays and the politics groups that dominated the shortwave newsgroup at this time. In short all of you are a bundle of cowards, you are running away from the high ground of the shortwave newsgroup. Wake up, fight back your rights. That is your group, don't allow the infiltrators to throw you out of your own newsgroup.
The infiltrator has discovered that all you in this shortwave newsgroup are all weak. You cannot compose a very intellectual article or contribute valuable information related to shortwave which you can learn out of it. Instead all of you placed rubbish topics, using offensive languages on your posts and insulting each other.
In order to throw out the infiltrators, you should learn how to compose a good article related to shortwave which everybody will learn. Because its not only you are reading or viewing this newsgroup but it becomes the focus of the world to read articles. Even though they are not a member of this group but they read those articles that you post in this shortwave newsgroup. Remember this is the Internet, people get information from this medium.
Google shortwave newsgroup is not moderated why, because they want freedom of speech and expression to post a good article related to the topic and accept criticisms on the article posted on the group and allow also exchanging of views in a certain article. It doesn't muzzle free speech or express its views. Google shortwave newsgroup is like a mirror of democracy in the public arena on the Internet.
Stop hiding, there is nowhere to hide. Go and challenge the gays and politics infiltrators on your shortwave newsgroup. "STOP THEM".

Andre

No websight, I made it up myself but no longer have a schematic to remember.
It was in the receiver
2.5 mh choke from the 1st RF amp feed (relay NC) to Gnd followed by 2 diodes
back to back before the coupling cap on the gate of the first FET in the
front end.
If you don't know what your doing stay out of it, all tight inside the
bottom

Pictures at:
http://mywebpages.comcast.net/mnowlen/urm-25d.jpg

Military AN/URM-25D Signal Generator, 10 kHz to 50 MHz Tunes
Continuously in 8 Bands

Perfect match for your R-390 or ANY other radio operating over the
frequency range.

SPECIFICATIONS:
Frequency Range - 10 kilocycles to 50, 000 kilocycles ï¿½ .5%; ï¿½
.05% from 1 mc to 50 mc when calibrated against integral crystal.

Tuning Bands And Range Of Each Band--
(1) Band A --10 to 27 kc
(2) Band B 27 to 80 kc
(3) Band C-80 to 230 kc
(4) Band D 230 to 680 kc
(5) Band E -.68 to 2 mc
(6) Band F 2 to 8.3. mc
(7) Band G 8.3 to 18 mc
(8) Band H -18 to 50 mc

Output Voltage (RF) 0.1 to 100,000 microvolts continuously variable
(across a 53.5 ohm external load).

Types Of Modulation:
Amplitude modulation -0 to 80%, (indicated accuracy within +10%).
Internal modulation frequencies: 400 or 1000 cycles per second + 5%.
External modulation frequency: 100 to 15,000 cycles per second.

Power: 103 to 126 volts, 50 to 1000 cycles, single phase AC.

In very good condition, checked, all bands working to full output.

Includes copies of TM 11-5551B URM-25B Full Maintenance Manual and TM
11-6625-278-20P URM-25D Supplement.

$125 + Actual Shipping Cost (No Packing Charges)
Send Zip code for shipping costs.

Broken / junk tube testers just don't seem to bring the same prices
as they once did - I feel for ya man.

Maybe you could add some terminology like "Minty new" or
"Original Prototype owned by Mr. Heath" Or you could even
take it apart and call it 'unbuilt' - Hmmm

Or simply raise your opening bid from the paltry $225 you're
at to $1250 - that way people will think it's REALLY special,
not just sorta special. Such a low starting price is probably what's
keeping folks from bidding.

==========
Roger:

A ordinary 12.6 volt filament transformer will work. The turns ratio for a 120-volt primary to 12.6-volt secondary is about 10:1. That is an impedance ratio of about 100:1 and that will reduce the 300-ohm output impedance to about 3 ohms. That will match a 4 or 8 ohm speaker reasonably well. Hook the speaker to the 12.6-volt winding and the 120-volt primary to the 300-ohm output of the BC-348.

A better solution is to use a 10-watt, 70-volt line to 8-ohm voice coil transformer. That will provide an excellent match.

Don't replace the output transformer in the BC-348.

Best Regards,

Ed

Source record: 31269

Can anyone advise the best way to drive an 8 ohm speaker
from a BC-348R O/P stage? There's about 0.8 watts available
- should be enough for low volume listening.

The phone outputs are "high" impedance (4,000 ohms) or "low"
impedance (300 ohms.) There is no 4 or 8 ohm winding on the
transformer.

My thoughts are:
1. Add an external matching transformer, say 4,000 ohms to 8
ohms. This might be an old tube radio O/P transformer -
4,000 ohms seems to be close to the anode impedance that I
remember when I built these things. Of course, you then get
two transformer losses.
2. Change the BC-348R O/P transformer to one that matches a
6K6GT anode impedance directly to 8 ohms. BTW, what is the
anode impedance of a 6K6GT? But I'd rather not butcher the
set - it is totally original and working, including 28 VDC
dynamotor.
3. Side-step the whole issue and use a separate audio
amplifier, e.g. "1/2 a pair" of PC powered speakers, i.e.
one! This is getting to look better daily - I have a spare
pair, but not tried yet.

Presently listening on typical Hi-Fi phones (Koss HV-1's),
at the 300 ohm O/P setting - a bit of a mismatch!

Thanks for all replies.

Cheers,

Roger

The filament transformer idea is one of the best. Been doing it for years. You might also look for a vintage LS-3 military speaker. They're set up for 500 ohms. Another possibility is to buy one of the newer tactical speakers, LS-188, 454, etc. They, too, have the requisite 500/8 ohm transformer, inside (make sure before you buy!!).

>coil transformer. That will provide an excellent match.

Right. These can even be had at Radio Shack.
Sometimes you can find used speakers, from store music systems, with the small matching xformer built onto the back, just like in old tube table radios -- but for matching to 500 or 600 ohm lines, not output plates. I have a couple of these, and they're very handy around old or military BA rcvrs.

>Don't replace the output transformer in the BC-348.

Certainly not in a set that still has its dynamotor! Besides, the output xformer and B+ filter choke are sealed up in that one can. If you remove the choke, you end up with no grid bias on the output tube, which is unhealthy.

I know all this because I got a BC-348 that had been "upgraded" with a few mods. --Mike K.

Thanks, everyone, I really appreciate the comments.

I'll either get a matching transformer or just use an
external amplifier.

Please believe me, I really was not going to change the O/P
transformer - sacrilege!

Cheers,

Roger

You can build a simple resistive divider and feed it to an external amp, like the AUX input on an old stereo amp. That way you don't have to modify anything, and it can be used with different equipment. I have had one for over 20 years, and it has a level control so you don't overdrive the power amp. I used it a lot for unexpected patches between sound systems and rental equipment.

Source record: 31204

I have been looking at the Heathkit hw-101, the atlas 210x, and various alinco mobiles. My main concern is cost. I only have 250-300 to spend on this unit. I am obviously not particular about type. Is it cheaper to get a mobile and use it as a transceiver or just get an old base station and use that? I am really quite interested in the old analog dial types. Any suggestions? CW is a must.

I am looking for a schematic, manual, or any other info on a 2-30MHz, 100W, USB/AM/CW transceiver used by the Coast Guard and designated the RT-1033/URC-77. Built by Scientific Radio Systems of Rochester, NY, this is a hybrid (uses 6146s in the final amp) transceiver with 10 crystal controlled channels.

I've checked most of the usual surplus houses and have found nothing on this one. Anybody know where I can find some info?

73,

Ron N4RT

Realize that Heathkit and Atlas are out of business. There IS something to be said for being able to troubleshoot and keep an older rig like the Heath going. Also, you will need a 12 Volt 20 amp power supply for the mobile type rigs, and this cost may have to be added to the cost of the rig.

I recently found this site dedicated to the Heath 101; you might be interested in it.
http://www.elinkusa.com/hw-101/

Good Luck

Got a call today from a guy whose truck fleet has gone cellular and wants to get rid of his old Motorala equipment.

He described them as 12" x 18" and very heavy.

I asked him for a model number and he called me back with:

T45vbj5gooaksp80

I have not seen them but have to make a decission on them by tomorrow. Do I want 10 them (for free) ??

Of course. If it turns out they aren't useful (ie. modifiable for 6M FM),
you take them to a hamfest and sell them.

For Sale or Trade:

NOTE: I do not want to ship. All items are PICKUP ONLY, or I can meet/deliver within 150 miles of Atlanta, Georgia. I can also deliver items to Praters Mill Hamfest or Stone Mountain Hamfest.

Hallicrafters HT-37 Transmitter - SSB/AM/CW transmitter. Covers 80, 40, 20, 15, 10 meter bands. 100 Watt output on 80-15. 90 Watts on 10. The only modification is the PTT mod and it is all internal. All knobs are original. Front panel is excellent. Cabinet is original paint and has some light scuffs on the edges. No extra holes. I would say it is a 9 on a scale of 1 to 10. All transmitter functions work excellent. Copy of manual included. Overall a very nice transmitter. $200

Hallicrafters HT-37 Transmitter - SSB/AM/CW transmitter. Needs work. The SSB generator needs repair. I have the parts. Works on CW only. Covers 80, 40, 20, 15, 10 meter bands. 100 Watt output on 80-15. 90 Watts on 10. All knobs are original. Front panel has some scratches. Dial is missing red frequency marker. Cabinet has been repainted, but color is very close to original. Light scuffs on the edges. No extra holes. I would say it is a 7 on a scale of 1 to 10. Copy of manual included. With a little work this transmitter could be put back in original working order. $100

National NC-300 Receiver. Covers 160, 80, 40, 20, 15, 11, 10. No converters. No crystal calibrator. Functionally the receiver works very well. Cabinet has quite a few scratches on the top. All knobs are original. HV caps have been replaced in power supply. It is a 6 on a scale of 1 to 10. Copy of manual included. Overall, the receiver works very well. $125

Johnson Viking Matchbox - Model 250-23 - 275 Watt Matchbox. No meter. No directional coupler. All original. No mods. No extra holes. Cabinet is excellent. "Decal" on back is all there and in excellent condition. Terminal strip, feed through insulators on back all original and in excellent condition. Internal relay works. Unit will match balanced line, coax, or single wire. Original Johnson manual included. $150

Thanks, and 73,

Greg Roecker / N4OSJ

I'd look for a nice Icom IC-735 or Kenwood TS-430S. They can be had for around $300-325 in decent condition. You will need a 12v supply but a car battery will do (or preferably a deep-cycle battery). A 20 amp, 12v supply like an Astron 20 will cost about $100 new or probably around $50-60 used. Might be a little above your price range but would probably be worth the extra $$ in the long run.

For mobile use, stick with the Atlas 210 series. They are very simple analog radios and nothing can touch them for the price. I wish I had one to sell you, but I am holding unto the two I own. The 210 will work directly on auto 12 volts, no power supply needed. The tube sets have filaments and will require a power supply. A few hybrid sets (mostly transistors but just a few tubes in the RF amplifier) have built in AC and DC supplies (certain FT101s and I think also Kenwood TS520).

I personally do not like the audio on the Heathkits (high pitch and tinny). The Hallicrafters have very nice audio, like Collins, but are probably too pricey for you. Also quite good are the Nationals. Look for a three band NCX-3 (should be comparable in price to an HW101). Also, older Drakes, particularly the TR3 can be found at very reasonable prices. But the best bargain for a home station in the Kenwood TS520. For a few bucks more, an FT101 (which also has AM capability). The Kenwood and the Yaseu are not as easy to work on as the all-tube sets, but are much more refined with 1 khz tuning, RIT and lots of other bells and whistles and also great sounding rigs. I do have a TS520 which is headed for Ebay so drop me a line if you are interested. Also, if you want more information about Nationals or Hallicrafters

FS: Gonset GSB-100 LSB, USB, FM, AM, CW transmitter. This is an item from an estate sale and is unchecked so that's why I am selling it so cheap at $125. It appears unmodified and has a manual. Front panel looks very good and cabinet will clean up nicely.

# 4392. Re: hf transceiver

Newsgroup: rec.radio.amateur.boatanchors

For sale - TACOMA WASHINGTON PICK UP ONLY

To repeat - PICK UP ONLY - I always get 5 emails asking
how much shipping to xxx would be! If I could I would, but
it's a large beam and would be really hard to ship.

TA-33 beam - 20-15-10 Meter - good condition, with a new set
of bushings and instruction manual. Includes CDE rotator and
controller - 5 wire version - beyond that I'm not sure what model.

$125 for all - will not split up - PICK UP ONLY - Tacoma, WA

Did I mention it is PICK UP ONLY? Good!!

Dave WB7AWK
Tacoma WA (In case you missed it above :-)

Source record: 31221

So the wife is out of town and I was actually able to find some time to play with my sx-71.... It really works well... So I sat there thinking,,, Could this radio, since it has FM, be made to pull in the FM broadcast band. I was thinking of some sort of doubler or switch-able coil could be added as it already picks up below the fm band...

Any suggestions or thoughts????
Bob

# 4398. FS: Working BC-348 with dynamotor.

Source record: 31215

Post script:

Found a small furnace control transformer in my spares box -
120 VAC to 24 VAC, i.e. 5:1 and "free". This converts 300
ohms to 12 ohms - close enough for an 8 ohm speaker.
Connected it up last night and it works.

As a "DIY" Hi-Fi builder for years, I'd prefer an "audio
grade" component but this sounds fine - of course very
Lo-Fi!

Cheers,

Roger

> it already picks up below the fm band...
==========

Well, all FM is not created equal. The FM broadcast band is wide-band
FM and your SX-71 is designed to receive narrow-band FM. The normal
FM broadcast receiver uses a 10.7 MHz IF and a wide-band
discriminator. Your SX-71 has a 455 kHz second IF with a narrow-band
455 kHz discriminator. There is no practical way to get decent
reception of wide-band FM on a SX-71. If you want FM broadcast
reception on a communication receiver, get a SX-42 or SX-43, or
perhaps a SX-62.

Best Regards,

Ed

If you are running the radio on an AC supply (not the dyno),
be sure to "float" the B-. Returning B- to ground will
eat your audio output stage.
That blasted CQ magazine power supply diagram from the
50s that returned the B- to ground has been the cause for
many trashed BC-348s.

Not quite right. Probably T45VBJ5600AK-SP80. This is the normal
format for M model numbers. The letter V indicates a vibrator power
supply. The -SP80 suffix indicates special production of some sort.

>
>I have not seen them but have to make a decission on them by tomorrow. Do I

IIRC the B-series receiver was pretty decent. You can always pull it
out and use it for a base station receiver with an AC power supply.

Same is true of the transmitter, though the power supply is a little
more involved.

Yes but for just a few more dollars one might step up to the TS-440 and get full band coverage, shortwave coverage for receive, memory, etc......One heck of a radio for what they are going for and far more than a TS-520, 820 or 830 in preformance..

Ron WA0KDS

Source record: 31235

All rohn stuff is new, never installed. Some was stored outside. galvanizing may be a little dull, but none of it was ever used.

25AG4 flat top set up to be used with thrust bearing $75

Tilt over tower base section, gets set in when you pour your concrete. $75

ROHN drive rods and base- great for field day and temporary set-ups. $40

20 feet of the galvanized anti-climb facing to be bolted onto bottom of tower sections so little kiddies dont climb your tower. $25

Paypal and money orders ok, pick up only near Phila., PA on the large stuff. Drive rod base can be shipped fed-ex ground.

Will be @ Kimberton PA hamfest this weekend.
Thanks!
Jim

Thank you for all the responses. You guys are most helpful. Here is my next step. There is the BRATS hamfest in Maryland that I will be going to at the end of the month. It will be my first fest. I'm rolling out of here at 2:00am to get there when tailgate sales begin. Are the products pretty good from hamfests in general. The radios I have my eyes on are the ts-520, ft-101, ten tec 555(not sure but if the price is right why not), and still the atlas 210x. What do i need to look for to keep from getting suckered. Hams are a pretty honest bunch from what I have learned, but I still do not want to be taken for a ride. I do have some electrical experience( avionics in the Navy).

Thanks

For sale:

Good condition Cushcraf R7 vertical antenna - covers
10, 12, 15, 17, 20, 30, and 40 meters. Uses radial
rods and does not require ground radials. It's all here,
in good condition. Mostly assembled - easy to put
back on the air. No missing parts. Comes with instruction
manual. Works great - I just don't use it anymore.

$140 PICKUP ONLY in Tacoma, WA. I cannot ship this
antenna - I'd have to completely take it apart, so please -
don't ask for shipping. PICK UP ONLY :-)

Jpegs to serious local inquiries.

Pick up only - Tacoma, WA

SHELVES of old radio magazines - almost all are from the tube era - 40s, 50s, 60s, and 70s - QST, CQ, 73, Ham Radio, and others. I have not sorted by year - it would take too long! Bring a bunch of boxes - there's a ton of these things! Fun to read - zillions of tube projects, reviews of old time gear, ads for Collins and Drake, and all the rest. Many complete years - tons of really fun reading for someone interested in the past of Ham Radio.

$75 takes ALL (ya gotta take em all, but not to worry - they're all good!!) - you'll find folks selling SINGLE YEARS for $15 and up - this is a bargain!

Local only - shipping would be very costly. Tacoma, WA

HAM RADIO AM bandwidth limitations threatened!
YOUR ACTION NEEDED!

Please go to the FCC website and tell them not to impost statutory limitations on the bandwidth of an AM ham radio signal. 5.6KHz is just too narrow. 6KHz or 8 would be better, but is there really any reason to make it a rule?
The AM community uses little space and polices itself.

The FCC has assigned an RM number, RM-10740, to the petition that seeks to ban high-fidelity SSB, and to cripple AM below 28 MHz with a 5.6 kHz bandwidth limit. Comments may be filed through the ECFS page on the FCC Web site.

Here is the URL to the FCC ECFS search page:

http://gullfoss2.fcc.gov/prod/ecfs/comsrch_v2.cgi

To view the bandwidth petition, type RM-10740 in the PROCEEDING window. Then go to the DOCUMENT TYPE window, scroll through the pull-down menu, and select PU, for Petition for rUlemaking. Click on the RETRIEVE DOCUMENT LIST
button. You should see some information on the petition, the two clowns who filed it in May, and a link for viewing the document. When you click on the
link, you will see the petition as a .pdf file.

To view the comments that have been filed, type RM-10740 in the PROCEEDING window, then select CO (for COmment) from the pull-down menu in the DOCUMENT TYPE window. After clicking on the RETRIEVE DOCUMENT LIST button, you will
see a list of all comments filed to date. To view them, click on the link at the bottom of each listing.

Here is the URL for electronically filing comments.

http://gullfoss2.fcc.gov/prod/ecfs/upload_v2.cgi

When you click the URL, you will be taken to a cover sheet. Enter RM-10740 in the PROCEEDING window, fill out the other blanks as directed, then type your comments. As an alternative to typing your comments directly on this
page, you may write them as a Microsoft Word document, using the standard formatting for legal documents, then you may upload your Word document.

Do not use macros in the Word document. Since macros are popular places for planting viruses, the FCC software will automatically discard documents that contain macros.

Source record: 31153

I think we should take this seriously.
The petition is technically flawed to begin with,
and the commissioners could easily adopt this without
knowing the sinkhole we'd be stepping into.
2.8 KC measured at what place on the bandwidth of
the signal? 3 DB down? Six? How about the bandwidth
at 30 DB down? If we're going to set a standard in stone,
they're going to have to get more specific than "2.8 Khz."
Signal bandwidths ain't square, ya know.

This could get to be a snake pit real quick.
And imagine the "bandwidth police" it would create:
dozens of old farts with nothing better to do,
looking at spec analyzers
(without any real understanding of what they're seeing),
then pouncing and pronouncing.

If they *must* adopt some type of bandwidth restriction,
a better standard would be a ratio
between bandwidth and total power output.
Something like a 3 DB decrease in PEP per doubling of
bandwidth over a 1.5 Khz standard measured at 3 DB down
from signal peak. 2500 PEP for a 1.5 Khz test tone,
1250 PEP for a 3 KHZ signal, 625 for standard AM.
Yes- some of the AM "big boys" would have to crank it
down a bit, but that's better than being stuck above 28.8 MC.
This way, broader signals are proportionately weaker,
which will correct the problem without restricting experimentation.
And that's just a suggestion; someone better technically
qualified than me can produce a better ratio formula.

It doesn't require it but it's nice to be able to use studio quality audio
if the band is not crowded and I don't want to listen to to someone that
sounds better than a duck with it's balls caught in a goose trap!

It's about time.. These arrogant SOBs running several KW have
staked out there frequency and just "run of at the mouth" about
how great their audio is BUT they do not gife a crap about How
far they splatter? NO. "AM = Ancient Modulation"

Come on everybody, write, call or email the FCC and tell them you
are sick an tired of the AM splatter on 75 meter phone. That AM
is an Antiquated mode and should not be allowed to continue
to suck up bandwidth at several times the bandwith of other
modes. Just to accomidate a few Egotistical twits.

WHEN WAS THE LAST TIME YOU OPERATED am in the last
ten years?? I'll bet at least 98% said NEVER.

THINK ABOUT IT.................

Just my opinion..

Apparently you guys just don't get it. It's not just AM that's threatened by the proposal, it's SSB as well! I don't know what kind of rig you are currently running but did your pee brain realize that the proposal would likely obsolete YOUR rig too. It's suggested, right in the petition, that everybody put filters in their microphones to reduce the bandwidth of current rigs .. are you doing that? Now please show me your ignorance and tell me how your rig meets the 2.8 khz standard suggested by the proposal. Then I'll have to challenge your technical abilities because the proposal doesn't specify how to measure it and how far down the signal has to be at the 2.8 khz point. I just love stupidity!

As to AM .. and I understand your concern to be bandwidth .. why aren't your amateur activities confined to CW? After all, CW is very bandwidth efficient and the fact that you pin heads are all using up all of this bandwidth on SSB makes my skin crawl! I think I'll file a petition next to reduce SSB bandwidth to 1/2 khz so that we all have room to carry on. Let's put three filters in the microphone to use less bandwidth. Efficiency .. efficiency!!

Besides now you are free to use whatever bandwidth you choose, as long as you meet reasonable standards. Are you willing to accept being told that you must sound like a duck with it's balls in a goose trap?

ANYBODY WHO SUPPORTS THIS PETITION IS A TECHNOLOGICAL IDIOT! I DON"T MEAN DUMB, I MEAN STUPID!

Robert,

Your ignorance is showing! AM does not necessarily equate to splatter and poor signal quality. In fact, as a whole most of the AM signals I hear are clean and sound fantastic. It's all about a certain pride that AM'ers take in putting a good sounding signal on the air and have the brains to make it happen. Now I'll admit that there are a couple now and then but not as a whole.

Also AM does not equate to "Ancient" anything. There is a whole broadcast band dedicated to AM right now and it's very current.

Hawk .. you got your head up your *** or what?

What is the longest section length as it is ready for transporting?

Don
---
<<
For sale:

Good condition Cushcraf R7 vertical antenna - covers
10, 12, 15, 17, 20, 30, and 40 meters. Uses radial
rods and does not require ground radials. It's all here,
in good condition. Mostly assembled - easy to put
back on the air. No missing parts. Comes with instruction
manual. Works great - I just don't use it anymore.

$140 PICKUP ONLY in Tacoma, WA. I cannot ship this
antenna - I'd have to completely take it apart, so please -
don't ask for shipping. PICK UP ONLY :-)

Jpegs to serious local inquiries.

Dave WB7AWK

Very common Amphenol connector, just contact any Amphenol dealer with
the right number and he'll get you one.

Same connector fits Heathkits.

You might call Electronic Supply in Billings MT 406-252-2197. Blaine
may have some laying around.

Unfortunately the longest section is the most difficult - it's the part
with all the tuning stubs on it - about 10 feet tall. The base portion
is around 7 feet, and I think that's the original box size. But I
would REALLY hate to disassemble that top section with all the
stubs - it would be a nuisance for the buyer to get it all back
together again.

But I suppose if you're really interested I can work something out.

<< > WHEN WAS THE LAST TIME YOU OPERATED am in the last
> ten years?? >>

Couple of days ago. 50.400. Had a couple of nice QSOs using my just-restored Gonset Comm IV. Nice sounding old rig. 'Course, that WAS above 28.8 mc.

Have a nice day.

A

# 4444. FS: TenTec Omni-D Series B w/PS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-09 19:03:18 UTC
From: GS <greatsurplus@hotmail.com>
Message-ID: <00e8961da0a74222bb27ab2c6df1d4ba@news.meganetnews.com>
Source record: 31168
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

For Sale:

Ten Tec Omni-D Series B with matching power
supply. All manuals. Full output on all bands.

See it at:

http://www.greatsurplus.com/page8.html

Scroll down to see the Ten Tec. This thing
as the FASTEST t/r switching (QSK) of any
rig I've ever used - it's totally instant if you
want it to be, even at high CW speeds. Amazing
given the older age of this rig.

Issues: tuning dial slips - needs adjustment
Also, the CW sidetone is raspy.

Otherwise excellent - hot receiver, 120+ watts
out on all bands, including 10 meters. Has 1
Aux band and a 10 MHz band slot that could
be used for WARC coverage if desired.

All manuals included.

$325 plus shipping via UPS from 98466 - will
ship in two boxes - one for supply, one for rig.

Thanks for looking.

Both you and the FCC are flawed in how you look at things.

FCC: The FCC should not specify the means by which bandwidth is to be limited. By requiring a filter in the audio input, they preclude other, probably better, methods.

You: If the FCC specifys a 5.6kHz bandwidth, without telling you *how* to do it, you have good options.
Option 1 - If you have a nice AM boatanchor and it is not capable of SSB, put a filter in the mike line.

Option 2 - If you have a SSB rig and want to run "AM," introduce enough Carrier Leak to satisfy the sideband's requirement for 100% modulation. Or leave the carrier attenuated 30 dB or so and use it to sync a carrier insertion oscillator at the receiver. In any case, the Carrier occupies no bandwidth, so you still have 5.6 kHz for the one sideband you use.

This doesn't need to be a lose - lose situation.

By the way, look into some of the crap the ARRL has been putting out recently about the new 5MHz "channels," which is in line with your topic. Some of their "technical" discussion is embarassingly stupid.

Don

opcom posted, in part:
<< Please go to the FCC website and tell them not to impost statutory limitations on the bandwidth of an AM ham radio signal. 5.6KHz is just too narrow. 6KHz or 8 would be better, but is there really any reason to make it a rule?
The AM community uses little space and polices itself.

The FCC has assigned an RM number, RM-10740, to the petition that seeks to ban high-fidelity SSB, and to cripple AM below 28 MHz with a 5.6 kHz bandwidth limit. >>

Larry posted in part: << As to AM .. and I understand your concern to be bandwidth .. why aren't your
amateur activities confined to CW? After all, CW is very bandwidth efficient and the fact that you pin heads are all using up all of this bandwidth on SSB makes my skin crawl! >>

Really good point Larry:)

We can get legislation passed to restrict CW to 5 wpm to reduce the CW sidebands.

Seriously, though, you make some valid points.

>audio WHY

It doesn't require it... but the bandwidth is there, so why not use it?

If there was an issue with the bands being crowded down there, I could see the argument. But there really isn't a problem so I don't see why the FCC needs to change anything.

---
No need to get carried away emotionally. Your attitude about AM is not very smart.

I'll bet a lot of the splatter you hear is because you do nothing to reduce strong signals at the input to your receiver. Not that there aren't any poorly adjusted transmitters out there, but there is no more splatter from a properly adjusted "AM" transmitter than from a properly adjusted SSB transmitter.

With your attitude you will divide people and lose what is most important.

Source record: 31176

I have a URM-25F Signal Generator for sale. Comes with the
DA-109 Dummy Antenna, CN-406 Impedance Matching Network and
the CN-224 10:1 Attenuator.
This is a late model, with none of the BBoD's found in the
earlier versions (replaced with disc ceramics in the -F version).
It has a cal sticker attached showing the last calibration was
performed in January 1988.
It also has a 3 wire AC line Cord (looks like MIL Mod).
I will also include a nice (readable !) copy of the Tech Mamual.
Works great electrically, a tad rough on the outside case, but the
front panel looks nice.
$150 plus shipping and I will guarantee it works.

# 4454. Suggestions about bandwidth ..

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-09 23:07:31 UTC
From: Larry <net1@netohio.com>
Message-ID: <Qe1Pa.1025$ce.51235@news.uswest.net>
Source record: 31177

Guys,

It's time to really get serious and try to understand the bandwidth issue, not just get emotional about it. The reason is simple .. if you jump on the band wagon and mutter some nonsense about AM, it isn't going to benefit anyone. This whole petition is about some guys who hate Enhanced SSB, trying to stake out their turf and what may result is that ALL HAMS get some serious restrictions that are going to prove bad for all. Sort of like having a law that says drive at a sensible speed and having someone try to get a bill passed to limit the speed to 35 MPH.

1) The problem can be at the receiver end. If the signal that you think is too wide or splattering is REAL REAL strong .. try putting some attenuation in the circuit. Most modern rigs, which are probably the worst offenders, have some method to attenuate the input signal. Try it and then retune and see if the problem is as bad. Also REDUCE your RF GAIN control. Personally I preset my AF gain and use the RF gain control to adjust the level. In some rigs you will find that setting the RF gain control so that the S-Meter comes up to about an S-9 will help cure not only splatter and wide signals but also help eliminate noise and static. TRY IT!

2) Also the setting of the AGC control helps too. On SSB you should be using a SLOW or LONG setting. When you tell the AGC to return to full gain slowly, it doesn't pump and not only will the other guy sound better but nearby loud signals will have less effect on the signal that you are tuned to.

3) Also choose your filter settings if you can. Many of the new rigs allow you to define your filters and that is one of the beauties of some of the new DSP rigs. A good selection for SSB would be 2.1 khz, 2.8 khz and 3.4 khz. By using a narrower filter you reduce the adjacent signals and any QRM that you might be hearing. For instance, I use a Kenmore TS-870, and if I am listening to a QSO and someone moves in a little close, I can drop the hi end filtering down a bit and many times totally eliminate what might be termed "splatter".

Sure there are some guys out there that really don't know what they are doing and run their rigs balls to the wall, AM or SSB. But where do you keep your power control sitting, all the way up? Try backing it down to maybe 75 watts instead of 100. Does you linear say it will do 1200 watts and you always run it at 1500 because you can and it will do it? Well maybe you are causing unnecessary splatter! Pushing your transmitter on SSB is equally as harmful as the guy on AM that just plain cranks it up. If you realized how little difference 1200 and 1500 watts really is, you may not do it!

I do AM as well as SSB. I have a little Viking Ranger boatanchor that I restored and reworked. With just 45 watts out of it I have had a lot of fun

talking all over the country on 40 meters and 75 meters. Don't knock it untill you try it. If you really want "silly" I put audio into my signal generator and with a calculated 45 milliwatts onto my 40 meter dipole worked a guy almost 225 miles away on 40 meters. AM is just as much fun as SSB and they both are legal so ya pick yer poison and let the other guy pick his!!!!!

That's why it's AMATEUR RADIO. There are still regulations
regarding spectral purity--if an AM station is splattering
across several SSB channels bandwidths, than there is a
problem with the station.

Peter,

This guy doesn't have a clue! He's caught up in the emotional side of the argument. It's obvious that he has no idea about the equation and less of an idea about what the bandwidth issues are from any kind of a technical point. This is the guy who will argue "studio quality" and crank his 1200 watt linyear to get 2700 out! He probably has a less than telephone quality signal and occupies 14 khz on SSB!

"a Salty Bear" says it all .. teached on the CB as to them bandwidth problems good buddy!

I believe he is talking about SSB, where they are allocating a major part of 6kHz to one sideband. In some circles, that's considered about the same quality as broadcast quality on the AM band. personally, I don't support that use of the spectrum, but it may be technically sound.

Re: << Several thousand unused AM rigs for six meters, and many MHz of unused VHF spectrum. >>

That's unfortunate.

Government agencies are hurting for spectrum. Now that the ARRL is under Homeland Security you need to be thinking about the big frequency grab they are getting ready to pull. It's far easier to take spectrum from the amateur radio service than it is to force government agencies to make better use of what they already have. You are first going to see the ARRL roll over for their new boss, and give up some of 2 Meters. There are already people there who think of 2M as "channelized."

Stay involved. Be heard in the right places, such as in comments to the FCC and ARRL.

Don

Let's be sure our comments help preserve what we have.

I wouldn't put anything past the FCC and ARRL. Their missions seem to
be to screw things up just when they are going well.

It looks like this person is trying its very best to thank me for posting the link to the FCC's proposed rulemaking page about the SSB and AM bandwidth limitations.

We can tell that it is an educated person, by the excellent punctuation, case usage, good command of the language, and also by how the comment is well-reasoned and presented without emotinal bias.

Not only that, it used an anonymous remailer, to try to hide. What a silly little thing. I wonder what it might be so fearful of?

So, here we have a validated example of the kind of mentality which supports the proposed rulemaking.

I merely found it amusing, perhaps the reader will as well.

Here is the message, with the special wording blotted out.

===

From:
Anonymous via the Cypherpunks Tonga Remailer <nobody@cypherpunks.to>
Comments:
This message did not originate from the Sender address above. It was remailed automatically by anonymizing remailer software. Please report problems or inappropriate use to the remailer administrator at <abuse@cypherpunks.to>.

"thanks for posting that link to make comments to the FCC I sent them my support for the bandwidth limits because of all the a**h*le am sh**heads with sh** signals that make half of 20m worthless I sure am glad you posted that
link I probably would've heard about it or been able to get my friends to support it"

===

well, time to go dig out another modulation transformer.. hehe..

Not studio quality.
Studio quality AM is +/- 5KHz.

+/- 3000-3500 Hz is communications quality, and fine for AM. but we don't need more rules.

SSB? 2.5KHz is fine. I am speaking up for the old iron. I do limit my AM to +/-3KHz in the speech amp.

A good point. I use no speech processing other than an old tube type hifi equalizer to cut off the stuff above 3KHz. I think the widest my rig has ever been is +/-3500 Hz at -30dB, as seen on a spectrum monitor. Unfortunately
many hams can't afford one, even an old beater like mine.

The best thing for AM is a very clean audio chain, especially a modulator with very low distortion. Unfortunately, most modulators as designed in plate-modulated ham-type gear are underpowered, so they start to distort the
signals, especially the lower frequency ones, before 100% modulation is reached. An example is the Johnson Viking I, a boat anchor to be sure. Below 400 Hz, the tiny modulation transformer just can't handle the 50 watts or so
needed to modulate the final. Unfortunately, alot of distortion results, and leads to splatter. Not wanting to modify the 'antique' rig, I reduced the input to the final to 40 watts at carrier, so that the modulator can deliver
a clean 20 or so watts very well.

"Salty Bear" refers to my Scout Woodbadge Training. You know scouting, that activity where we try to give back to youth some of the peace and enjoyment we have. One if the highlights of my amateur career was paying $500 for a 12 day all expenses paid vacation in Virginia in August of 1997. During this vacation, where my bed was in a tent with 25 other men, we worked not less than 12 hours a day, were expected to monitor the Camp repeater anytime we were vertical. Part of the K2BSA crew at a BSA National Jamboree is an experience that is unrivaled in hamdom.

So I hope your reference to Salty Bear is not a reference to a 11 meter handle. That was King's Bookie BTW, and I do not regret talking on 27 Mhz either. The group of people I talked with there exhibited better communications knowledge and good manners than are found late at night on 75 meter phone.

As a rule, I wouldn't put it past them either. But there's enough 2m
HT-geeks in Hartford or DC to really raise a stink, even locally, if
they tried to do something like that.
I can see it now..."The Million Man Squelch Tail March". kchht.

Well, some are being used this evening. Had a few QSOs on 50.400 and worked both coasts on 6m. Love it when the band opens!!

These are OUR bands. USE THEM!! If they're active, it is MUCH harder for commercial interests to try to steal them.

Government agencies are hurting bigtime for UHF spectrum, and to a lesser extent for VHF spectrum. But there is a huge amount of stuff in the HF bands which is allocated for commercial and government use, which is no longer used at all. Likewise the VHF-LO business band is mostly dead, and right now you can get nationwide licenses for VHF-LO channels for a few hundred bucks at auction.

I'd be happy to trade a chunk of 2M for an equivalent chunk of the VHF-LO business band. What is going on is not that there is an increasing demand for channels, but that the demand has changed. 800 MHz is crowded as hell and everybody wants a chunk. 12 MHz is dead and nobody wants any.

The ARRL should be petitioning to grab some frequencies of our own.

There is a LOT of AM aircraft radio gear out there which is currently
not legal for use because of the new narrowband channel allocations for
aircraft use. Those radios are basically available for the asking at your
local avionics shop.

And those radios are no problem to convert over to 2M AM. 6M wouldn't be
so easy.

What is this chart that you are using? Are you talking about measuring
resistances in-circuit with the manual for the equipment?

What is this pin?

Does the mixer stage work? If the tube tests good and you are getting
signal at the IF strip, don't worry. If you aren't getting signal, something
is wrong, but if the in-circuit resistances are wrong it's probably not the
tube that is wrong.

Not quite a "boat anchor" but not very new either

I am trying to get this old Clegg FM 21 220 MHz rig working again
and need information on alignment. A schematic would be helpful
also. This is a six channel crystal controlled transceiver.

Is there anyplace on the web to down load this type info?

I don't intend to spend much money on this repair job.

Thanks
Bill K7NOM

# 4485. Resistance Checking

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-10 17:21:06 UTC
From: Chuck / KE4ETH <chuck_hawks@hotmail.com>
Message-ID: <nlfPa.11692$K67.6783@fe04.atl2.webusenet.com>
Source record: 31106

I have a question about checking resistance via chart in manual.

A tube check good on a tubetester, but the resistance is way off from the chart. 5k ohms vs. 200k ohms. when the tube is pulled the pin measures about 175k. all other pins check within 20-25k ohms on every tubes including the questionable tube.

does this mean this tube is bad or only unusable for this application. It's the RF mixer in a Tempo one (the manual is packed, we had some floor replaced and I can't get to it at the moment.

It's the first RF Mixer.

Thanks

Chuck

You will get a more useful reply if you can give the identity of the tube.
( 6BA6, 12AU7, etc, etc.)

The resistance charts supplied with the older tube gear was usually measured
with the tubes still in the sockets.

73,

WA5VRL
Willis

Other than the filament pins and some really specialty tubes the tube
had better not have any effect on the resistance measurements and if it
does throw it as far as you can.

Its not too uncommon to have a grid with more than one pin connected.
On the socket there may be some components tagged off of one lug and
others off the other. Pulling the tube will break that continuity.

# 4498. My Comments to the FCC on RM-10740

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-11 15:54:38 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3F0EDDBE.8A91EA5E@ix.netcom.com>
Source record: 31121

11 July 2003
In the Case of RM-10740:

I respectfully submit to the commissioners
that the proposals of Mr. Lonneke and Mr. Ladisky in
RM-10740 not be adopted, on the following grounds:

1. The bandwidth standards they propose are technically
flawed, in that they do not adequately define the
bandwidth limits. Simply stating "2.8 Khz" is meaningless
without reference to at least two amplitude levels on
the bandwidth bell curve and a defined standard test modulating
signal. To adopt a rule without these exact standards
is to invite a flood of complaints based on subjective guesses.

2. The petitioners have not presented documentation
concerning how they concluded that the signals about which
they complain were overly broad, other than their subjective
senses. For instance- many HF receivers are subject to
distortion in the front-end at high signal levels which creates
spurious products within the front-end of the receiver.
Improper use and/or adjustment of noise blanking circuits
can create spurious products within the receiver's IF circuitry.
The petitioner's have presented no technical standards
whatever on which to base their complaint, so we cannot
know if the above conditions are or are not the case.

3. The petitioners have not demonstrated that the
practice of which they complain is either currently
wide-spread or increasing. In fact, the practice is
limited to a vanishingly small number of licensees.
Moreover, the history of Amateur Radio strongly suggests
that, over a reasonable period of time, peer pressure
and a waning of interest in this "enhanced SSB" mode
will correct the problem.
The petitioners are asking the FCC to go to
the effort and expense of rule making over
a minor, self-limiting problem.

4. Adoption of this rule would go against the FCC's
stated objective of streamlining and reducing
government rules and restrictions.
There are already rules within Part 97 (97.307, 97.101)
that stipulate transmissions shall not use more bandwidth
than is required for the type of emission used.
While "enhanced SSB" is an experimentation- a defined goal

of the Amateur service- it is not a new type of emission
and is, therefore already in violation of Part 97.
New rule making is not needed.
If licensees wish to experiment with the variation of
SSB signals known as "enhanced SSB,"
they can do so at VHF frequencies where there are less
restrictions, or apply for a Part 5 Experimental license.

5. This rule making could lead to the requirement of
type-acceptance of transmitters in the Amateur service,
or even channalization. Such a requirement would utterly
destroy one of the stated purposes of the Amateur service:
to encourage experimentation and provide a pool of
people acquainted with communications technology.
Adoption of type-acceptance rules would effectively
end the Amateur service, leaving only "plug-n-play"
operators without justification for the spectrum
allotted them. It would also require the FCC to
draft an entire new class of rules and standards
to implement the type-acceptance, with the resulting
expense in both budgetary and human resources.
Current Part 97 rules adequately address
the issues in the petitioner's complaint.

6. Adoption of this rule would seriously impact the
legitimate users of A3H modulation. These users are
already restricted to effectively reduced radiated power.
They voluntarily restrict themselves to small
and agreed-upon frequency "windows."
They are generally well behaved and tolerant of the
interference they receive from SSB transmissions.
Moreover, this group of legitimate users work to
preserve the history and development of amateur,
broadcast and military radio.
They also provide a pool of technical expertise
useful to the A3H broadcast industry.
Notwithstanding the emotional protests of a few
who dislike A3H, there is no credible evidence
that these A3H transmissions have caused
significant hardship on any other licensee.
Implementation of this arbitrary bandwidth
standard could effectively ban
these legitimate licensees from the air.

Thank you for your time
and your consideration of these comments.

Respectfully Submitted,

David L. Stinson
Commission licensee AB5S
Wylie, Texas

# 4499. WTB VOX board GT550

Hello to the list,
I am looking for the VOX board for a Galaxy GT-550. I believe it is the same one used in the GalaxyV Mk III. Anyone got one not being used? If not, does anyone have the jumper board that is used in place of the VOX board that allows the use of PTT in these rigs.

Thanks to any responses.

Can be reached direct at k5vse@voltage.net

The parts are easily worth the price, if you're willing to
do the work involved with dismantling/selling them. And you
could probably sell complete units at a hamfest for say
$10.00 each.

Hi from Spain:

I have a very old Signal generator from Gen Rad. This one is the model
805 C

I will be very grateful if somebody would can sent me a brief plane
of the RF stages (RF Osc. and RF ampl.)

Thanks in advance.

Joaquin

# 4513. F.S. NICE HEATHKIT ITEMS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-12 16:51:51 UTC
From: Big Red <csfd@hotmail.com>
Message-ID: <H0XPa.665$yy6.52203675@newssvr14.news.prodigy.com>
Source record: 31136

I have some very nice Heathkit items for sale:
Heathkit HA-10 Warrior 1KW H.F. amplifier
Heathkit RX-1 receiver with matching speaker
Heathkit DX-40 transmitter
Heathkit VF-1 VFO
Also a Swan Cygnet Model 260 SSB transceiver.
All these items are out of a estate and are very nice.
I want to sell ALL items in a package deal and would be interested in a nice late model HF rig or cash.
I don't really have the time for e-bay so lets make a deal.
Serious inquiries only please !

# 4514. TS-520S : Something Arcing

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <76d1bdee.0307121011.17c6a4f5@posting.google.com>
Source record: 31137

Hello...
Someone is lending me a TS-520S to use and I have been listening to HF on it for a few months now. Thursday evening I got my CW and general credits. I had only planned on leaving with CW but I got my general. I have an inverted V, about 130' long, in my backyard. The feedline is 450 ohm ladderline and it is converted to 50 ohm coax at a balun at the window, where all my cables enter the shack. Last night (Friday) I went through the manual and tuned up the radio for 14.075 CW operation. I then tuned the antenna with the tuner, but could only get 30 watts out, or the SWR would be over 2 : 1. That was fine since I was on HF and running CW, so I proceeded to switch to SEND and started calling CQ. I got as far as: CQ CQ CQ DE KB1JEC/AG KB1JE and then the meter (set to IP position) pegged and the lights on the radio dimmed and seemed to go on and off very fast. The overhead lights in the room went dim. I could hear something, like an arcing noise, apparently from the finals section (i think?) I immeadiatly shut the main power on the radio off and turned off the heater and send switches before turning it back on. I had done everything the manual said to do, all in the proper order. I then re-tuned up for 14.075 CW, thinking maybe I had made a mistake somewhere and done something wrong. Same thing happened again while calling CQ. I then turned to a large group of hams i've known on IRC since before I had my ham license. They walked me through everything for about 4 hours. They had me look to see if the tubes were properly neutralized and everything seemed to check out fine. After 4 hours and no success I thanked them and then talked to the owner of the rig. He said that the same thing had happened to him before, but he replaced the 6146 final tubes with a new 'match set' before giving me the rig to use. He will be coming here to have a look at the radio Sunday, but hes not sure of what could be wrong and neither am I. I tried a different band, 80 meters, this morning to see if that would make a difference. I tuned up for 3.530 CW and then tuned the antenna, still getting only 30W out to keep SWR below 2 : 1. I proceeded to call CQ, carefully watching the plate current meter. The meter would rise a little from 60mA every time I keyed my straight key. But then, whether I was keying or not, the needle slowly started to rise, slow at first, then faster and faster until it pegged and then the lights on the radio flickered quickly and the room lights dimmed, the rig making the arcing noise again. I can prevent it from pegging by switching from SEND to REC before the needle pegs, but how am I supposed to hold a CW QSO like that? And what about SSB phone? I couldnt talk more than 15 seconds on SSB phone in that case. I dont have a mic wired up to try it yet but it would probably peg faster than CW because of the duty cycle. I don't know what could possibly be wrong with the rig. The

finals were replaced, with a match set, it checks out ok for neutralization, and I replaced the driver tube with a new one just last week. What could it be? I don't know much about tube rigs, but I do know something is definitly wrong. Thanks and any info is highly appreciated, going to post this on packet as well..

# 4515. HW101 Replacement Microphone Suggestions/Recommendations Sought

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-12 18:43:29 UTC
From: Paul Clay <mrvanski@yahoo.com>
Message-ID: <3F1056D1.143865D7@yahoo.com>
Source record: 31140
Cross-posted to: rec.radio.amateur,rec.radio.amateur.boatanchors

The old Heath microphone I use(d) with my HW101 has finally died and I need to get a replacement. Rather than trying to find another old microphone for a replacement (e.g. off EBAY), I'd like to purchase a new, current (reasonably priced) model microphone. Would appreciate any

helpful suggestions in this regard.

Beyond the microphone being high impedance (60K-100K?), and push to talk, I'm not sure what I need to be looking for (or avoiding) when looking through a current catalog of available microphones.

Thanks,
Paul

Not all 6146 tubes are identical, first find out what tubes were placed in
this
Kenwood.

Then read Glen Zook's K9STH web page article on the 6146 Family of tubes.
http://home.comcast.net/~zcomco/The_6146_Family_of_Tubes_1.htm

That's a start.

Source record: 31139

Short version:

The whole problem stemmed from the fact that the "B" series of tubes is not the same as the "plain" and "A" series. The parasitic oscillations were caused by the different bias requirements and by the "fixed" neutralization of the driver and/or amplifier tube in the Motrac. There was no practical way to change the circuitry to handle the "B" series tubes. Also, making such a change would void the "type acceptance" of the units.

In a "practical" sense, it is "OK" to mix 6146 and 6146A tubes since the primary difference is in the design of the heaters. But, NEVER mix 6146 / 6146A tubes with a 6146B! This is really "asking for trouble".

I have used a TS520 for as many years as they have been out and never had a minute's problem. Never any problem with various tubes. You need to try it into a dummy load.

Something wrong here. If more power is causing your SWR to increase
then maybe you have some arcing in your antenna, tuner, etc.
This may aggravate other problems related to tuning the rig, type of
tubes, etc.

More and likely the problem began when he was attempting to tune the antenna and tune the output of the 520. It is quite difficult to do this from scratch.

As suggested put the rig into a dummy load to insure it is actually operating correctly. If you don't have one. Get one. Makes life much easier.

Another pointer. Do you know how to 'rough adjust' a antenna tuner? Just turn on the receive on the band you want. And fiddle with the controls of the TUNER only. Adjust for maximum noise or received signal and youwill be very very close to correct settings. This way when you fire RF into it you wont need to adjust the tuner much further.

Just some pointers.

Also check your BIAS.

Howdy Douglas...In your post, the one thing that jumped out at me was your statement "But then, whether I was keying or not, the needle slowly started to rise, slow at first, then faster and faster until it pegged and then the lights on the radio flickered quickly and the room lights dimmed, the rig making the arcing noise again". This more sounds like a bias problem, and would be a typical sort of problem I've seen in rigs of the era whereby the bias voltage to cutoff the tube during receive starts to fail causing the tube to conduct.....more conduction=more heat and it degenerates into the sort of symptoms you've described. Typical things could be shorted screen or cathode bypass capacitors or even a bad zener diode used to regulate screen voltage (the rig escapes me at the moment). Check in your manual (hopefully) to see what the idling current should be.....if set high, for example this could aggravate the problem. It's been at least 10 years since I stuck my head inside a 520 so circuit details don't come to mind to help further. Best of luck.

Source record: 31047

I am offering two homebrew 4-1000A amplifiers, with the below listed extra items, for TRADE only. I have never had either of them powered up. There are some nice quality high power RF parts inside these if you'd rather use them for parts. For trade material I am particularly interested in other boatanchor gear ( NO HEATHKITS! ) or ESPECIALLY 1920s - vintage battery sets. Don't hesitate to make me a trade offer, I am very interested in getting this stuff out of my garage. I've decided I won't be able to use this stuff at my current QTH.
The catch is, they are so heavy that it will be necessary to pick them up at my QTH in Westminster, CO ( near Denver ). I would like to get rid of the stuff all at once, so bring a truck.
Again, I'm really only interested in trades for this stuff. Contact me at rmdittmar@attbi.com or ab0cw@qsl.net if you are interested.

You can see all the stuff at http://www.qsl.net/ab0cw/amp41000.htm

OK, I have seen a similar problem with a 6146 and 6146W mixed -
which resulted in a resistor failure.

Source record: 31050

Right on.
99% of the SSB activity that is the focus of all this is on 14.180 or
thereabouts.
It is hardly widespread, and is never likely to become so. It may be
annoying to some, but the number is small, and the supposed increased
bandwidth used by most practitioners is small. And as you point out a
bandwidth limit, with only a cutoff frequency specified, is utterly
meaningless.

This petition is the kind of pointlessness that drives FCC people crazy
for no good reason, undermining the hobby's bargaining position when
really serious issues come along.

I have tuned it up into a dummy load and the problem still occurs in dummy load mode. Its not the antenna or tuner. Although the dummy load IS inside the tuner. Im 100% new to electronics, well, maybe 75% at least ;), so I don't know much about the internal workings or how to change things inside other than the potentiometers and tubes. I will tell all of this info to the rig owner tommorow and see what he says/can do about it. 73 all and keep the posts coming if you folks have any more info that could help me ;)

I hit a similar fault on an TS-820S. Remove the cover from the final
compartment. Tune the rig into the dummy load. Increase power until
you hit the arcing. Dim the lights in the room and watch the plate
tuning capacitor. In the case I cured, the mechanical joint between
the rotor shaft and the capacitor frame had become dirty. I fixed
it with some control cleaner and that fixed the fault. Hopefully
this will help. Note that arcing cannot easily be seen in a normally
lit room. Also, be very careful as you have pretty high voltage in the
final cage just looking for something to hit!

I guess if I couldn't afford to drive to the guy's house and ask for my money back that I'd file a written complaint with all ham groups, businesses his locality and credit organizations. At some point the idiot has to squeal for relief.

FS classic RCA deluxe receivers.

AR-88 one of the most recognizable receivers of WWII.
Many thousands were shipped to England and Russia where they contributed greatly to the Allied effort in defeating Nazi Germany. It is still a great performer
The one I have, I recapped and replaced out of spec resistors and tubes. It was
aligned according to the manual (copy included) and is very sensitive. All controls
work. It doesn't have an s-meter. Cosmetically it does show ware and I did all I could to restore it's original appearance. The cabinet was sandblasted and repainted.

CR-88 is the same as the AR-88 but with a beautiful s-meter and crystal filter. It was produced after WWII in the late 40's or early 50's. The one I have is in great original shape. Cosmetically it looks very nice! This is a working radio that I have replaced all
Weak tubes and aligned it according to the manual (copy included).

I'm asking $200 obo for the AR88 and $250 obo for the CR88.
Pick-up only in Travelers Rest, SC (near Greenville)
Make me an offer!

Dale Kight ripped me off for $200 in May of 2000. Took my money and
didn't deliver the equipment. (Check the archives for my posts in
July of 2000) He lives in Maui, so is hard to get to. Some day I
will take a vacation trip to sunny Hawaii.

Gary Dion, the fellow who had the latest go-around with Kight, was
lucky to get his deal completed, in my opinion. And then there was
some fellow who was taken to the cleaners by Kight around 1996. I
think it was Alan Gray, W3BV.

So I would like the thread to continue as long as possible.......

Be careful of this guy.

73,

Mike Fallon K6YOQ

Before you burn up everything put the correct fuse in the radio. It should
be a 6A. If it's dimming the lights in the room then it's too big.

Hi,

I recently aquired a "De Forest Audion 566". The box had "566 (866)"
written on it. I can't find any data on the 566 or whether it would be
reasonable to substitute the device in a circuit which calls for a 866A.

Any assistance would be appreciated.

Thanks !

Ed

The WARC coverage for this rig can not be enabled without the
installation of quite a few bandpass filters - no longer available
from Ten-Tec.

Without them, a major amount of engineering will be necessary to put
the rig on the WARC bands.

BTW, that slipping tuning dial is simply due to the PTO needing a
rebuild. PTO rebuild kits are available for around $20 from Ten-Tec.

Doug

If you like the sound of these, you might try the modern EV RE-16, with
a transformer to step the impedance up.

But even an SM-57 with transformer will probably make you very happy.

Why?

Some of the 5V ones will pull-in at 1.5V in a pinch.

The 866A is a half-wave mercury rectifier used in transmitters,
modulators, and similar equipment. It's rated 10,000 volts PIV and
0.25 amps average.

The tube is in a large ST-shaped package with a large plate cap and a
four-pin base. Height is 6 9/16 inches including pins and plate cap.
The diameter at the shoulder is 2 7/16".

You can usually see small drops of mercury clinging to the inside of
the glass. Does this sound like your 566?

At these power levels, I would not suggest substituting one tube for
another unless your ABSOLUTELY SURE that the sub is correct in your
particular application.

I wish I could remind all those ninnys calling AM an "archaic"
mode that SSB has been around about, oh, seventy five years.
Shall we also do away with CW and RTTY just because
they meet an arbitrary age limit spewed forth
by some emotional boob with nothing better to do
than grind his personal axe? What a childish argument.

And can be replaced by 12 series 1N4007 diodes and a dropping resistor.
Or if you can stand the higher B+, just the diodes.

You'll find your power transformer runs cooler without that rectifier
filament load too, and you get reduced hum.

What is this for? Do you need one or hundreds?

If you need hundreds, Omron will wind 'em custom for a reasonable extra
fee if they don't have them in the catalogue.

Why do you need this? What kind of current do you have available? Why
can you not use a switching FET to fire a higher voltage relay?

Folks
Has anyone come across an RCA AR88 with a front panel in a silver/grey hammer finish, intead of the customary black? Was this a legitimate variation?

I am being offered one (that looks like it may have been rackmount in a homebrew cabinet), original knobs but no S-meter for $100.

Any advice?

Adrian

Sadly, with all the NRSC crap in place, it's close to that. Didn't used to be a decade ago. It's going to get worse with the new regulations that are coming with IBOC too. AM quality is just going to hell and it's the result of the listeners, the FCC, the station owners, and the radio manufacturers all not giving a damn.

## 4579. Looking for a switch, capacitor or meter?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-15 01:48:08 UTC
From: "G.Beat" <now9spamgb@spam.comcast.net>
Message-ID: <s3JQa.62839$ye4.44057@sccrnsc01>
Source record: 31003

When restoring a "boatanchor" it is not uncommon for a switch, variable capacitor or meter to require repair or replacement.
Often, the original manufacturer of the equipment (and their procurement notes) are long gone.
Even the original USA part manufacturers are hard to find, largely due to the mergers and acquisitions over the last 15 years.

While a "parts rig" may be an alternative - it is not always a viable or affordable option.
Here is my very short list of current US part manufacturers (and when available the name of companies they purchased)

Rotary and Lever Switches (e.g. Collins, Heath, Hallicrafters, Hammerlund, National, others)
==========
Electroswitch Electronic Products - Raleigh, NC
http://www.electro-nc.com/

This company was established in 1986, as a new division of Electro Switch Corporation, which celebrated its 55th anniversary in 2001.
Electroswitch acquired the switch product lines from a "Who's Who" of part manufacturers.

Stackpole (1986)
Shallcross (1987)
ASM (1988)
CRL/Centralab (1992)
Eaton Commercial Controls (1999)
OakGrigsby (2003)

Cross Reference from this list of companies OR competitor companies
http://www.electro-nc.com/switches.shtml

---

Variable Capacitors
==========
First, an excellent web-based introduction to capacitors & information repository
http://my.execpc.com/~endlr/index.html

Cardwell Condenser
Dr. G. A. Cardwell manufactured telegraph keys and sounders for Western Union Company in a factory in New York City.
http://www.cardwellcondenser.com

Cardwell has also acquired a "Who's Who" of part manufacturers.

1971 - Hammarlund Capacitor Company of Mars Hill, North Carolina.
1972 - Variable air capacitor division of Johanson Manufacturing Company, Boonton, New Jersey.
1973 - E.F. Johnson's variable capacitor division.
1980 - Multronics, Inc. of Fort Lauderdale, Florida, a manufacturer of air inductors
1998 - The balance of National Radio Company
---

Oren Elliott Products
"Our company is always happy to assist experiments, inventors, and universities in the development of new products", Steve Elliott president of OEP.
http://www.orenelliottproducts.com/index.html

Oren Elliott Products is the largest domestic manufacturer of air-dielectric variable capacitors. OEP has been producing capacitors since 1925, first as American Steel Packaging Company and then as All Star Products. OEP was recently "rediscovered" by restorers of the Heathkit HW-8 QRP transceiver. Mr. Elliott encouraged capacitor replacement orders from HW-8 owner, and suggested a couple of improvements with the planetary reduction drive.

Their N50, S2 and S3 product lines should look familiar to many restorers of the All American 5 tube radio and amateur radio receivers.
---

Analog Meters
==========
Simpson Electric (still alive and kicking) - Elgin, IL
http://www.simpsonelectric.com

Simpson's Global Repair Center Look-up
http://www.simpsonelectric.com/calnr.htm

Hoyt Electrical Instruments - Penacook, NH
Best known for supplying the actual analog movements for many meter mfg. (100 years ! )
Hoyt has acquired the analog instrument documentation from
Bartlett Instruments, Ft. Madison, IA in 2000 (who supplied the meters for Collins)
http://www.hoytmeter.com/

For Sale:

Hallicrafters SX-99 shortwave receiver. Upgrade from
the S-85 - adds an S-meter and crystal filter.

Works but has low audio. Front panel bears the yellowing
of being in a smoker's shack many years ago. Will
need a good cleaning. Missing the band switch knob.
No mods - nice cabinet with decent finish. Easy restoration.

Pictures via email on request.

$75 plus shipping via UPS from 98466

Thanks!

For Sale:

Good working Compaq 286 12mhz 640k 'luggable'
computer. You know the one... looks like an old
sewing machine case!

Green phosphor screen - 20 mb hard drive. I used
this with a CW program on the serial port a number
of years ago - worked great for that. Also made
a fun packet terminal. I think it still has DOS ham
programs installed, but not sure now. Does have
Microsoft Works and a bunch of DOS utilities.

Neat old boatanchor computer!

$25 plus UPS from 98466

Photos to interested parties via Email

I just want to extend a thank you to all who offered their opinions, good and bad, (mostly good) about this 64 or so year old radio. The BFO doesn't seem to work very well, but I don't listen to very much slop bucket, so I'm not too concerned. The audio is FANTASTIC!! It uses a Philco #41 in the output stage and a new 5" speaker had already been installed. I really enjoy listening to OTR (Old Time Radio) that I download from kazaa and have already added an audio input jack to this radio so I can play stuff like "The Shadow" and "Suspense" on it, right from my sound card. No, I didn't drill any holes in the chassis for this mod!! I just tapped into the 6SQ7 tube via a .1uf cap and a 1meg resistor to ground. Then I tune the radio to a quiet spot (it's dead quiet around 40-45 MHz) and flick the switch from Receive to Standby. OTR really has to be played through glowing tubes to be truly effective and appreciated. The reception on the shortwave end of things seems to be as sensitive , if not more sensitive than my S-38C, but far more selective, and it sounds much better. Also, I'm not as afraid to touch the thing, like I am with a series set!

# 4597. Why don't Real Hams you face the facts?

All the garbage about how you should even be allowed to operate a CB, unless you are able to build your own equipment. Real Hams will never be able to build a rig that even comes close to what's available off the shelf these days. Most people can't even be bothered, have no interest or don't have the time to build rigs anymore. Boatanchors should be used for exactly that, anchoring boats!

Time to stop whinging, and face the facts...Real Technology has overtaken you all!

From: holmdahl@televar.com
Message-ID: <holmdahl-35013F.16044515072003@news.televar.com>
Source record: 31022

Hi, I hope I have the right group. If not, please advise.

I just got ahold of a WW2, Navy DAK-3 (Intermediate Frequency Direction Finder) in good condition including: 1) CFT-46245, Radio Receiver Assembly, 2) CFT-69089, Cross Loop Antenna, 3) CFT-62138, Junction box, 4) CFT-66093, Sense Antenna, and 5) *maybe* some cables for above.

What I would like to know is a good place to market this item (big and heavy) and its value.

Any help or ideas would be super!

Thanks again,

Tom Holmdahl

Yes, I agree!! Furthermore, I think, IMHO, that that is what this newsgroup should continue to be about---the exchange of valuable information and the education of those less versed but definitely interested ones (people like me) in the ways of the firebottle. People who are intelligent enough to be interested in 50 year old (or more), 50 lb. (or more) pieces of radio equipment usually are intelligent enough to refrain from senseless flaming. Those with more neanderthal sloping foreheads are the ones who seem to knock what we do. There's ideas to be shared, and tips to be learned in keeping these fine old pieces of gear WORKING!!

Actually, the neat thing is that current technology makes homebrewing
more fun than ever! I can now build one hell of a nice receiver using
DSP technology and doing most of the IF processing in the digital domain,
using off the shelf stuff. And I can get performance that beats anything
on the shelf right now.

What I want right now, though, is a PLL on a chip that will take a simple
BCD or binary encoded frequency, and produce an unmodulated carrier. I
would be surprised if someone hasn't built something like that already
using one of those Sanyo mask-programmed microprocessors with the PLL on
the chip like a lot of CBs use today. Doesn't have to be a PLL, it could
be DDS too, but I want a single chip synthesizer that will tune 160 through
10 meters continuously and I'd like to avoid the microprocessor interface.

>Time to stop whinging, and face the facts...Real Technology has overtaken
>you all!

Whinging? I'm not winging, I'm having a great time! Real technology
makes this a great time to be a ham.

No I do not mind.
It took a few weeks of spare time to track down the information.

What I really would like to see is a reverse engineered "updated" parts list
for classic boatanchors.
The resistors and capacitors would be fairly straight forward -- with
notation for substitution of the
more commonly available value (e.g. 0.5 mfd original value -- 0.47 mfd
current part)

The harder parts are the air variables, analog meters, wafer and lever
switches that were
more common 50 years ago in electronic equipment. That is the reason for
the original research.

There are always some "custom parts", but with modern manufacturing and
computer aided design ---

these can be reproduced, IF sufficient quantities are required (demand) to justify a production run.

Television programming is filled with automotive, motorcycle and home restorations -- as well as
roadshows to reveal the true price of antiques. The demand is there -- and the money --- just needs focus !

This could be interesting, Scott. I haven't been keeping close track of the DDS stuff, but a few years ago you could get devices that were clocked at 40 to 50 MHz with 32 bit math (frequency steps would be tiny). Of course, even at 50 MHz, 15 meters would be approaching the Nyquist frequency. More useful might be a lower frequency oscillator (in the 5 MHz region) and then a mixer to the desired frequency (of course you have to figure in the IF too). I'm curious if the DDS stuff might also have a quadrature output. That could be *most* interesting as I suspect a decent sound card could take your monaural voice and, with DSP, put that into quadrature audio (left and right channels in quadrature). That, plus DDS with quadrature outputs ... and I could see a direct conversion receiver with *real* selectivity and selectable sidebands. I'm sure the DSP could provide better quadrature relationships and maintain even responses between channels than a number of filters. With a method to equalize the amplitudes of both the DSP outputs into the mixers as well as equalizing amplitudes of the DDS outputs to the mixers - we might see unwanted sideband and carrier suppression equal to some of the best radios around. Do you know if any DDS chips supply both a sine and cosine (quadrature) output? Or is this pretty much standard?

Some of the newer DDS devices (check Analog Devices' website) are clocking
at up to 400MHz (maybe more by now, as I haven't looked in a few months).

Some provide quadrature outputs.

Some provide on-chip phase modulation and/or FSK.

There are also techniques using harmonic aliases that will allow a
relatively low
frequency DDS to effectively produce a higher frequency signal ...

Lots of interesting stuff in the data sheets and app notes.

I dunno, if one person understands it and happens to have a source for PLLs,
I'll be happy.

It's true, though, that I can go to the trash bins down the street, and pick
up VCRs with wideband electronics that will carry from DC to 4 MHz, TV sets
with great digital tuner stages, really slick sweep amplifier stages that
can put out decent power across the whole HF band, and all kinds of nifty
stuff. People complain about technology today making homebrewing impossible,
but frankly I would have given my eyeteeth for this sort of salvage when
I was a kid.

Thanks for the tip, Carl. Geeze, Analog Devices. I should have remembered. It has been quite a few years since I worked in Materials Engineering and actually had a feel for the current state of the art. Heck, I was only off by a factor of 10 on that clock rate! 10 percent is one thing, but by a decade! :) LOL. Be grateful I didn't suggest wiring a bunch of 12AU7s together in flip flops. Hmmm ... where'd I put that core memory anyways? BTW, those 400 MHz devices are 10 cents per dozen, right? :)

I will check out the site, however; again, thanks for the tip.

I haven't seen a BCB Station license in decades, but every other
commercial station license I've seen had the bandwidth indicated
on the license.

Is that also true with AM Broadcasting, and if true, what
bandwidth is allowed?

"Studio quality AM" is not a valid term. AM Broadcast has never
been up to "Studio Quality" standards, which would be _at_
_least_ 20 to 20K Hz.

AM Broadcast Band quality is 5K Hz.

>+/- 3000-3500 Hz is communications quality, and fine for
>AM. but we don't need more rules.

Why so wide?

>SSB? 2.5KHz is fine. I am speaking up for the old iron. I do
>limit my AM to +/-3KHz in the speech amp.

There is no difference at all between the audio response
necessary for SSB and AM. AM, because it has both sidebands,
will necessarily take up twice the RF spectrum for the same
audio response, but in fact 2.4KHz (400Hz to 2800Hz) is actually
*preferable* to higher fidelity audio response when the purpose
is voice communications. (Ma Bell did a bazillion studies on
this decades ago, so it is not exactly new information.)

>"WB3FUP (Mike Hall)" wrote:
>>
>> And voice communications requires studio quality

Even with a wheel mouse, you don't need to read the garbage.

However, a wheel mouse would seem to be the answer for those
who make the silly fuss - the arrogant bottom-posters - would it not?

Why not snip the garbage out? Shift+pageDown to select it all, delete ..
it's done.
Saves bandwidth, server space, makes life easier for everyone.

HI, I have a nice old Tek 3T77 sampling sweep plug-in. It works quite well, but all the sweep speeds are a bit off.

Anybody have a manual for this thingy? Lots of adjustments in there, none of them labeled!

Thanks,

George

All of the AD synthesizers I have seen have a microprocessor interface,
where they basically memory-map into a processor. I'd rather have something
I can directly address.

I could probably pull out a 68HC11 to control the thing if I absolutely had
to, but I'd rather have something I can just latch a BCD input into.

Some of us have ALWAYS built our own equipment. That's why
some of us became "hams" --- so we could test it out.....

Alas, most today are appliance operators. I can't, personally, see any
thrill at all in spending 2K for a rig designed and built by strangers, and
spending a month reading the manual learning how to use it...

Still, there's room in the hobby for all of us.

And, in fact, there's a whole lot of us that have more degrees and
licenses than can fit on a good sized wall.

Enjoy whatever facet of it you choose....

Modern DDS devices would require too many pins on the device for
cheap packages unless they used some sort of serial communications
or a modest pin count multiplexed bus.

I doubt that you will find anything useful with a straight binary or BCD
input because the devices need too many bits loaded into them to set
up all of the internal functions/registers.

Bill posted: << I have listed a 102-D for Sale on ebay.com. >>

---

Nice little tube. Those were still being installed in Telco testboards in the early 60's and maybe later. The socket for this is unique....

If you look at the tube base you will see a pin at a right angle to the tube. The pin slides down a slot in a collar of the socket. At the bottom of the vertical slot, the slot continues at a right angle for a short distance. Turning the tube to the right causes the tube pins to engage spring steel contacts. The combination looks very nice on a finished board. I can probably find the pin numbers if anyone here buys it and wants the info.

Right. I am looking for something that might best be implemented as
an ASIC somewhere, in that it would be a special-purpose sine wave
synthesizer rather than a general purpose DDS device.

Wow nice site. He also has some MP3's of old 78's. Just the stuff to broadcast over your "wireless phonograph" to hear on your old Philco or Zenith.
(In my case an old Majestic / Grunow).

What? I've never heard that. Folks should know how their radios
work, that's why the FCC exam includes "theory". There's never been
a requirement to bring in a Home Brew transceiver as part of the
exam.

>
> .....and a true example of home-built radio was heard on 80m CW a week or

I've been licensed for 35 years and I've only met one person who
built an SSB transceiver from scratch. I know lots of folk who
have the expertise to repair them and many have built kits.

Sheesh! 1 GHz with a 10 bit binary counter. Only $350.00 each in quantities of 1000. Someone care to loan me over 1/3 of a million? Seriously, however, there are affordable AMD devices but they appear to be in the 50 MHz to under 200 MHz range.

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 20th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2003 Rates

SELLERS

This year each vendor must have a Cambridge Vendor License.
We will do all the paperwork to get the one day Cambridge licenses.
To keep the spaces affordable we are discounting your first space.
To use your spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space - includes $10 Cambridge Vendor License
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space - includes $10 Cambridge Vendor License
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

I could do that. Generate a 50-80 Mhz sine wave, then put it into a mixer with a 50 Hz crystal oscillator and turn it into a DC-30 Mhz signal. I think I could even get a brickwall high pass at 30 MHz so the whole thing would be broadband with no tuning.

Of course, you'd lose some stability in the process from those extra stages, but probably not enough to be a big issue.

Oh, and for 10M FM, of course, I could modulate the local oscillator.

Yup. I am sorry to report that my first homebrew rig did the same thing
too.

Some of the eastern european folks I know are still rockbound, and some of
them are cutting their own crystals. This is a recipe for parasitics, or
at least it was when I tried doing it in high school.

I think the wafer switches would be the most difficult. There are a
billion combinations that I've seen, and I haven't seen them all ;-)

One item I've considered is the knobs. You can sub electrical parts
and get the radio to work, but you can't sub knobs and still have it
look right. Few people see under the chassis, but everybody sees the
front panel.

Don't know if there is any good small-volume technology available for
such things or not.

Thanks again for the great leg work.

# 4674. FS: Complete Drake Station w/ extras

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-17 19:03:44 UTC
From: Al Lorona <al_lorona@agilent.com>
Message-ID: <3F16F310.114E6817@agilent.com>
Source record: 30946

Drake R-4A and T-4X, AC-4, MS-4. The receiver has some of the VE3EFJ mods, the transmitter is unmodified. A list of the mods follows:

1. New power supply filter capacitors mounted underneath chassis, original filter cans left in place on top.

2. Regulated +10V power supply replaces tube regulator. All original components left in place. (Receiver runs much cooler as a result of this modification.)

3. Audio power amplifier has been replaced by a solid state (TDA 2611) PA module. Again, the original tube and components are still there.

The VE3EFJ mods are well-documented. I have a copy of them that I can include with the manuals, but they are also available on the web. Search for "VE3EFJ drake mods".

The receiver has a full complement of JAN crystals (purchased in 1997) for the following bands:

1.5 - 2.0 MHz
4.5 - 5.0 MHz
9.5 - 10.0 MHz
14.5 - 15.0 MHz
18.0 - 18.5 MHz
20.0 - 20.5 MHz
24.5 - 25.0 MHz
28.0 - 28.5 MHz

Therefore, you have transmit on 160 m, 17 m, 12 m and 10 m bands, with receive of most WWV frequencies and some shortwave bands.

I have digital photographs that I can e-mail to you showing the equipment, mods, cabinets, etc. (Sorry, I don't have a web site where I can post them.)

All interconnect cables included.

Both original manuals in very good condition. (Photo available on request.)

In addition, I purchased a number of new Drake parts when the Drake factory liquidated itself of all parts in stock a few years ago, which are
included in the deal. These mainly consist of IF cans with coils, switches, a 5945 kHz crystal, spare PC boards, etc.

I also have four 6JB6 tubes in original boxes that are part of the package. These are spare finals for the transmitter.

To sweeten the deal, I will include a (fair condition) Shure 444 microphone with the difficult-to-find right-angle Drake-sized mic connector.

I am in the Los Angeles area and would really prefer to sell to somebody local. I will deliver to a 100-mile radius.

Price: $225.00.

Thank you for reading. Please feel free to reach me by e-mail, or by telephone at 626 390 3257.

Regards,

Al W6LX

# 4675. Wanted: SWAN Mobile Antenna Info

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-17 19:44:09 UTC
From: Norm VE3CZI <ve3czi@arrl.net>

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors

I recently "saw" a very interesting Mobile Antenna Designed and Made by SWAN Electronics in the '60s era.

It covers 80 - 40 - 20 Meters. Has One coil with two variable Capacitor arrangements tapped on the coil for adjustment for 40 & 20 Meters. There is access through a plastic cover to tune the capacitors.
It has a 4 ft rod below the coil, with this switching assy in center and a CB Whip on top.
It is totally automatic ie: electronic switching..no manual or relays...very interesting design.

** Can anyone recollect what the model Number is of this Antenna might be? There are NO markings on the Antenna.
** Has anyone got any information on this Antenna?

Tnx & 73...Norm VE3CZI

> called the "AC-DC" version of the S-40?

Because its basically an AC-DC version of the S-40. That means it can work either on Alternating Current (normal) or Direct Current (long gone these days). In its era there were still areas that used 120 volts DC instead of 120 volts AC.

> And why is there no power transformer in this radio?

AC-DC radios don't use (can't use) a power transformer.

Without the power xfmr considerable cost was saved in production. In this case some of the tubes are different and there is a ballast tube to reduce the filament voltage. The filaments are wired in series (like xmas tree lights) as opposed to parallel as in xfmr operated sets. The B+ in the set runs at a lower voltage than a transformer operated set since it takes voltage directly from the incoming AC (or DC) line and rectifies it rather than stepping up via an xfmr.

There's no real problem in doing this, in fact its very common in consumer electronics of the era. The main drawback in an older set is that there may be (and likely will be) leakage in the old capacitors that isolate the actual chassis from the neutral line inside the radio. When leaky, one side of the AC line is essentially connected directly to the chassis and this can pose a shock hazard so do be careful working around the set.

Good luck,
Bill

Gil the Acey - Duecy sets have the tube heaters wired in series. Using tubes like the 25 and 50 series, the string required heater voltage was near the line voltage. Some times a ballast resistor was used if needed to equal 117 volts. AC/DC radios do not have a power transformer, but rather rectify the incoming mains power directly; this saves the space for a transformer and, moreover, the considerable cost and allows the set to operate on DC mains as well.

Side note -- AC/DC models were mass produced and dubbed the AA5 -- All American 5 -- see URL:
http://pw1.netcom.com/~wa2ise/radios/aa5h.html

In all honesty, unless go in for VERY low power (< 1Watt), the problem is
that you are going to have real problems ensuring that you don't generate
unacceptable levels of spurious emissions. To properly test things to the
standard required nowadays, with today's high density of electronic
equipment in any residential area, you will need test equipment costing much
more than a brand new 'off the shelf' set.
But it is certainly possible to design your own passive circuits, for
instance filters and traps, without this risk being involved.
If you are interested in DX, then a commercially designed receiver is going
to be much more sensitive and selective, of course. This is due to the fact
that a multinational company has the development resources that an
individual could only dream of.
Obviously, you do gain a lot of respect for designing your own circuits, and
you will attract a lot of interest by doing so! So I don't think that 'home
brew' will ever die out in it's entirety! DN

Alright, I am really utilizing these newsgroups for the upcoming hamfest. Just picked up a ts-820s. Looking forward to receiving it and reading the manuals before operation. (Sometimes I wonder if XYL has influenced me with that). I would like to know some testing equipment I will need to get this rig in flight so that I can pick them up at the hamfest. I was reading some posts that talk about tuning the rig and it sounds like fun, albeit treated with respect like all high power electronics, but also more than a simple voltmeter will be needed. Any suggestions?

Yeah. I didn't post this as a joke, either. This guy really used to do it. And, one of the reasons I can't stand HF operation (other than the biggest reason being the hiss) is that when we Tech+'s used to get on and do all the "is this freq in use", etc....all the good operating practices we'd been told were going to be *absolutes* on ham radio--nearly every time there'd be some General or higher licensee who'd get on over us and start calling CQ...or would go just off our freq and begin.

Yep, there were good ones...just as there are good Novices, Techs, and Tech+'s. But, the bad ones ruin it for everyone.

Kim W5TIT

Well, I don't want to bash 10m as a band but it does seem to attract
some abberant behaviour, and a bit more worldwide than the same that
occurs on 75m and a few selected spots on 20.
Much of the bad behaviour is by CBers faking callsigns - or recent
CB'ers that have become Extras whilst still trying to kick the habit of
being obnoxious.
A shame really, but you are correct in your observations that the bad
ones ruin it for everyone, and if not ruined, it gives everyone else
something to whine about resulting in the appearance that everything is
ruined.
The streets are full of people who piss themselves and fart liberally.
They don't magically disappear when you tune the amateur bands. Thats
what all those tuning knobs are for.

-Bill

Fellow Amateur Radio Operators,

I have created a new list that deals specifically with legal issues pertaining to our hobby, the Amateur Radio Legal Issues List. The list is for the dissemination and discussion of legal issues (such as PRB-1 and pending legislation in Congress) and other related issues (court battles, etc.) that can affect our hobby.

If you are interested in such a list, please send a blank email to ARLI-subscribe@topica.com.

73's,
Paul Gray, N0JAA
Moderator, Amateur Radio Legal Issues List

My parents are retiring and selling their TV repair business.

They have for sale:

SAMS television photofacts, # 2838 - 4384 (qty 1,546). Also includes
the 1998, 1999, and 2000 annual index. All in excellent condition.
They wish to sell them all as one lot.

If you are interested or wish to discuss further, please reply ASAP
via private email.

Thanks,
Tim

Not sure whether you're talking about routine transmitter adjustments
during normal operation or test-bench type troubleshooting and
alignment. I'll address the first one. The second is best left to a
tech with proper tools, equipment, and training.

Transmitter tuning is critical to proper operation. You have to do
this whenever you change transmit frequency (by more than 10 kHz on 40
meters and below or 20 kHz or so for 20 meters and up). Improper
tuning can significantly shorten the life of the output tubes. The
sequence is given in the manual.

You need two items to properly tune the transmitter: a power meter
and a dummy load. Bird is the preferred manufacturer for both. They
make high-quality equipment that has been the industry standard for at
least 40 years. Try to get a model 43 power meter with a 100-watt HF
element. The full-scale power level and frequency range of this meter
are determined by the plug-in element or "slug". You can cover HF
through GHz frequency ranges with this meter and different slugs.

The dummy load is not critical. I prefer the Bird loads, but there
are others made for the amateur market that will work. The old
Heathkit Cantenna works really well.

You may find Bird Termaline wattmeters, which consist of a power meter
and a dummy load in one unit. The model 6154 is typical, but there
are many other model numbers. These are generally designed for VHF
frequencies and would not be suitable for your application.

Practice tuning the rig into the dummy load to learn how the Tune and Load controls interact. Always tune up into the dummy load first when changing bands, since this takes some time and you don't want to disturb other folks by doing it on the air. Then connect to the antenna and adjust the tuning to the antenna. You will probably want to install a coax switch to switch between the dummy load and the antenna(s).

And don't try to get every last watt out of it. The tubes will last a lot longer at 80 watts out than at 100, and nobody will hear the difference. It's a good rig. Have fun!

Source record: 30980

Hi all. Im looking for a Icom R-71A or Kenwood R-5000 so Im letting these go to fund it or make a trade. These are both real nice radios in working condition. S.H. from 55992 in Zumbrota, MN

The SX-9. Made in 1935-36. Is as close to perfect cosmeticly as you would hope to find. Restored front panel. The cabinet is the original wrinkle finish that has been cleaned and clear coated. Receives on all bands except Band 5 20mhz on up is very weak. A little tweaking may bring it alive. It needs the 6F5 tube for the 1st Audio. Somebody put a 6K7 in? This should improve the performance of the set. I don't have one in stock or I would have replaced it. The AVC circuit seems funny. Havent had time to check into it. May need a new tube? All caps have been replaced. The radio is as nice as they get. Just needs a tuneup and minor work. $300 firm. + S.H.

http://home.jps.net/~jonnysocko/sx9b.jpg

http://home.jps.net/~jonnysocko/sx9e.jpg
http://home.jps.net/~jonnysocko/sx9f.jpg
http://home.jps.net/~jonnysocko/sx9g.jpg

The SX-23. Made in 1939. Is very nice cosmeticly and works very well. Great cabinet and original lettering. It has some scratches that are not very noticable. I restored the finish and repainted the dial. It is a real beautiful radio. It was modified at one point in its life by the evidence of two extra tube socket holes. I had to rewire the power supply and audio section. It has a replacement filter choke as seen in the pics. I used a differant audio output transformer. The original was gone Easily replaced if you want to go back to the original 500/5000ohm out. It could use an h logo cover on the power trans to spiff it up. I replaced all the caps and the hard to get at ones in the RF deck and several resistors. I installed new dial string on the main dial,band indicator and A.N.L. switch. It needs a meter that swings in the opposite direction. The one in it is all I had. It works. Just a left shoe on a right foot. The radio will probably need an alinement but its very sensitive and WWV was right on 10mhz. It will need the band change and selectivity knob( Like on an SX-28). The ones on it are Hallis but there not right.The earphone jack will need to be wired into the circuit. Its all there I just got lazy. By the way its a very nice sounding radio. It will need the original 455khz Xtal filter that plugs in the socket. I have the main dial plastic for it but its warped. Its the same as the S-20R or SX-25 etc.. Real easy to duplicate. i paid $200 for the radio and did a lot of work on it so I was hoping to get at least $265 +S.H. to cover the parts and work Ive done.

IBOC requires the AM sidebands to be kept under 5kHz because of
the Digital Sidebands. Fortunately, the stations running IBOC are
getting a lot of flack from listeners regarding the horrid AM bandwidths.

Okay, so there is way more current going through the tube than should be.

What is the difference in voltage between the control grid and the cathode?

Is this thing oscillating? Is it interfering with nearby radios and TVs?

Am overhauling a Heathkit TX-1, came across a previous owner's component substitution in a Power Supply circuit, and wondered if it was improper:

It seem that there was originally a pair of 125 microfarad electrolytic caps (in series,total=250) with a 5.5 Hy 400 ma choke in back of it, and a pair of 5R4GY's in back of _that_.

The old owner subbed a pair of _200_ microfarad caps for the old, blown out 125's, maing a total capacitance of 400 microfarads. Now, I know the traditional wisdom has it that you may go up in replacement part capacitance value from the old, but that there's a limit on this, too; too much higher, and you may toast the choke and the rectifiers over time, as those components ratings may be exceeded by too much for too long during the capacitor charge-up.

Question: Is 400Uf too much of an increase over 250? Personally, I'd feel better about sticking in a couple of readily available off-the-shelf 100's (in series, total=200), and be a bit short, rather than nearly double the PS filter capacitance....it just seems too much.

Is there a rule of thumb for this?

Or am I just being too picky? ;)

Tnx to the group in advance,

Lin/KJ6EF

If you put 2 200 microfarad caps is series the value is 100 microfarad. No, going from 62.5 mf to 100 mf is not a big change, since the tolerence on most caps can be +100%, just as long as the voltage rating is the same or higher you will be fine.

I have some odd boatanchors that I am willing to give to anyone
who comes to get them! I live in the Detroit area. Just plain give.
No strings.

Let's see, there is an NC-98, SX-108, HQ-170, a Swan 500C.
All work, insofar as I know.

Tried this before, and got not bites! Hate just to throw them out..
Again, no shipping.

Ladies and gentlemen:

Available: ICOM IC-228A 2-Meter Transceiver (Radio Only)

Situation: This radio has no RF working inside, RX or TX. ICOM advises that the radio needs a coil and a diode, LW30 and RD30E-B2, respectively, and that ICOM no longer has these two parts in the supply pipeline. The radio is otherwise complete, intact and in good physical condition.

Consequence: This radio is yours for the asking.

Price: Gratis (Recipient will pay shipping if shipping is necessary).

Regards -

BOB CARTER W5BTC dc2light@radix.net H 301-884-4480

Actually, there is an IBOC mode where the analog signal extends to 8
kHz. This overlaps the digital signal occupying 5 to 10 kHz and lowers
its data rate. I think the station can pick whichever analog bandwidth
it wants (that is, I don't think the decision is subject to FCC
rules).

Actually, some knobs are not that hard - but you are correct about the
"look".
Some mfg. used "off-the-shelf" knobs from major manufacturers, others were
a bit more exotic.
Dakaware is still in business and had the molds for
almost all of the early knobs (or can make a new mold from one sample).

I think the early rice boxes (e.g. Yaesu/Vertex, Icom and Kenwood/Trio) may
be
the hardest to find for North American amateurs.

# 4735. Help Needed - Heathkit SB-400 Transmitter LMO Realignment Instructions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-21 13:26:12 UTC
From: Pat Richardson <reply@newsgroup.only>
Message-ID: <7qpnhvc0cb6c4rl0msof8jjpp3k10mioki@4ax.com>
Source record: 30858

Hi,

I'm restoring a Heathkit SB-400 transmitter, and need some info on how to realign the LMO (Linear Master Oscillator). Currently, it is running about 75 KHz high at the lower end of it's range (i.e., on the 40M band, it will not tune below 7.075 MHz), and is out of linearity by 16 KHz at the top of its range.

There is an adjustment on the LMO sealed with red paint - adjusting this brings the frequency range down to where it should be (not sure if this causes any other problems, though - it was sealed for a reason??), but the linearity problem remains.

Does anyone have any suggestions or literature on this unit? (the LMO is Heath Part No. 110-32)

Thanks,

Pat

# 4736. Two Draw Catches Needed

Newsgroup: rec.radio.amateur.boatanchors

Been trying to find a specific type of draw catch
for restoration of a WWII WASP Lear ferry service radio.
Looks like this:
http://home.mindspring.com/~arc5@ix.netcom.com/catch.jpg

Need two of them. Seems all the modern stock of draw catches
comes from the same manufacture, come in two sizes and aren't
even close to this one. I've looked all over the web and every
hardware store I can find in north Dallas.
I've even haunted antique stores, looking for old boxes
or anything that might have one of these catches.
Anyone have an idea where I can find older cabinet furniture like this?
Thanks,
Dave S.

I believe these are called over-center latches, though I wouldn't swear
to it. Among other things, they were/are used on hard-side suitcases
and trunks. Is there a luggage store within reach of you?

Dave,
look online for someplace that specializes in old trunk repair supplies.
Also, I've got an old Kodak projector box around her somewhere that has (I
think) the same latches on it. I'll look for it and let you know if I can
find
it and whether it matches.

If they were in series, the effective capacitance is 62.5 microfarads, not 250. You divide by two if you series-connect two caps of equal value.

>
>The old owner subbed a pair of _200_ microfarad caps for the old,
>blown out 125's, maing a total capacitance of 400 microfarads. Now, I

No, it makes a total capacitance of 100 microfarads.

>
>Lin/KJ6EF
>For email responses, remove "nospam_".

The question is wrong because the original calculation was wrong.

The substited value of 100 microfarads is certainly acceptable for an original value of 62.5 microfaracs, i.e. only a 1.6 increase. Since

many older electrolytics were spec'd at +100% tolerance, the originals coiuld have exceeded the nominal value of the replacement.

Modern capacitors are manufactured to tighter tolerances than older units. I generally don't exceed twice the original value when replacing vintage caps. You'll generally improve performance somewhat with the larger caps without stressing the associated circuitry. You can always go up in voltage, although the highest rated parts currently available are 600 volts.

Thank you for your help, Bruce.
When closed, the latch is 2 inches long and 1.5 inches wide.

Dave, I just scrapped a BC-221 with the wooden case. I'd swear they are the same!! I'll check the dimensions as soon as I can, but they look identical. If you have a '221 laying around, see if they aren't the same. You can have these if they're what you need.

Hi, Everybody,

I have been shocked to learn recently how expensive shipping can be.
What do you guys all do when you have to ship equipment?

I am selling a Drake station and took the AC-4 / MS-4 to the local
Mailboxes, Etc. store to get an idea of how much it would cost. They
told me that UPS Ground was $36.86 to ship from California to Michigan.
And that was not including the packing! And there would be two more
boxes to ship (for the receiver and transmitter)!

I had to give my buyer that sad news that, at these prices, I can't
afford to ship!

What is the best practice to follow when needing to ship equipment
across the country?

Thanks.

Regards,

Al W6LX

I bite the bullet and consider it part of the cost. I live in Zone 8
from most locations and the rates have skyrocketed in the past few years
compared to more local zones..
>

I have heard that the "Mailboxes" places mark up the UPS rates by about
20-25%. You can check the REAL rates online at their website. I hope
you didn't ask about the cost of packing or you'd just now be getting up
off the floor!

Pack it yourself and carry it to the Post Office or UPS.

What Bill said... I have found that going to Mailboxes, Etc., or anything like them, will cost right at twice what packing it yourself and driving to the post office costs. I live in Korea, and I have to use USPS to send or receive all my parcels. I have sent items much heavier than what you planned to ship for only about $35 to the east coast (APO's are charged from San Francisco). Pack it, weigh it, and check online at www.usps.com or www.ups.com for actual shipping costs.

I like USPS where possible but the items you mention go better by UPS.

Shipping them together should save some. I was surprised today when I shipped a rather large box, weight 21 lbs., from Alabama to Arkansas for only $12.49. That was from a UPS/Mailboxes. The USPS cost was like $19.00 for the same. They said they typically run about 10% higher than the UPS terminal counter prices. The cheapest way to ship is from someplace that has a UPS account with daily pickup service. A friend, maybe.

Still, shipping ain't cheap.

Pat -

First go to K4XL BAMA web site and download the tutorial for Heathkit LMO
Repair by Ed Kotkiewicz
ftp://bama.sbc.edu/downloads/heath/lmo/

You will need the DjVu reader -- if you do not already have it
http://bama.sbc.edu/viewers.htm

I may want to try the HeathKit reflector of owners and former engineers.

Shipping heavy items used to be cheapest by Greyhound Package
Services, but the drawback was that you had to take it to the bus
depot when you were the shipper and pick it up there when you were
the recipient. I don't even know if they do that any more.

Just this afternoon I shipped something from the UPS Store, the new
name for Mailboxes. Shipping was $12 and packing was $4. The "do
it yourself" cost would have been about $9 for shipping and $3 for
the right size box and packing (I've packed many a shipment so I do
know how to do it properly). The drawback is that I would have had
to drive about 15 miles to the UPS Service Center (it's 95 degrees
out today in the blazing sun and I would have to drive into the sun
to get there) versus the UPS Store about three minutes away locally.
It was worth the extra few bucks.

Don't ask why the FedEx truck drove up to the UPS Store just as I
was leaving.....

Forget UPS and their so-called "shipping agents." They've made it quite clear their not interested in residential business. Then Mailboxes tacks on 20% more? What are we wearing, "KICK ME" signs on out backs?
Look into Federal Express GROUND. Its cheaper than UPS AND the post office Parcel Post,packages are treated better, insurance is included and you'll have the item in 3 days.

Right, but they are also tacking a substantial fee on top of the UPS fee.
You'll find if you take it to the UPS depot yourself, it'll cost half
that. FedEx will be still cheaper. The pack and ship places are NOT
cost-effective if you do a lot of shipping.

Those are known as a "suitcase latch".

Try a specialty _luggage_repair_ outfit.

Another possibility is to see if "Anvil" (flight-case maker) sells 'parts'.

The ones you'll find in a hardware store are designed for use with wood,

The world has *CHANGED*.
FED EXPRESS "ground" is usually the least expensive way
UPS is considerably higher.
USPS "PARCEL POST" is even _more_ expensive, in general.

For 'medium heavy' stuff, if it's going between 'lucky' destinations,
AMTRAK carries station-to-station packages at rather reasonable rates.
They price in 50lb increments, but multiple boxes to the same destination
are priced on the _total_ weight.

Twenty percent? *HAH*!!! I've had MBE qoute a price that was in excess of
THREE TIMES what the on-line calculator at www.ups.com qouted. Admittedly,
it was a small, _light_ package,

> What are we wearing, "KICK ME" signs on out backs?

MBE is in the business of selling "convenience" -- to those who "don't know
any better." At a 'what the market will bear' price-point.

UPS recently _bought_ MBE -- look for the name "THE UPS STORE".

Remember MBE is a *franchise* operation. Costs circa $200,000 to open one.

Poor franchise sucker has to make his money _somewhere_. 'Surcharging' on
3rd-party services is one way.

They're a *FRANCHISE*. And handle FED EX shipments as well.

FED EXP 'ground' is usually cheaper than UPS ground, these days.

And FED EX _will_ pick-up.

I've been in the LMO.

SB-400? You have a tube model.

1. Tube is known good?

2. What do you mean by 75 kHz high? Do you mean the output signal
or the LMO as measured by a frequency counter is off?

3. I found a cold solder joint on one of the temp compensating caps
in a tube LMO. This was not on the wire to circuit joint. This was
the little coil of wire soldered to the end of the cap's ceramic
tube.

4. There is a known problem with dirty contacts between the LMO cap
rotor and the spring clip. Cleaning instructions are on my page
at http://www.kiyoinc.com/heathstuff.html

5. How "pure" is the LMO's signal? What does a scope show you or
how does it sound on a general coverage receiver?

6. Check the voltages too.

I'm guessing that you're close to getting it going.

> Marty AA4RM

Marty -

First, I recommend that new owners of Heath SB-200 amplifiers review these
web pages:

1. Bob Norgard's (KL7FM) excellent SB-200 rebuild notes with photos of
installation.
Bob provides great insight into preventive measures with the SB-200. The
filament voltage
on the tubes being the most overlooked and contributor to shorter tube life
for some amps.
http://home.gci.net/~rnorgard/ampnotes.html

2. Jeff Weinberg's, Harbach Electronics (hopefully Jeff will have business
moved by September)
http://www.harbachelectronics.com/

3. Not all 572-B Triode tubes are the same
http://www.rfparts.com/572bprices.html#comparison

4. We live in a free country -- and different viewpoints do exist regarding
VHF stability &
parasitic suppression:

Rick Measures AG6K is well known for his low VHF-Q parasitic suppressor
retrofit kits
and QST article
http://www.vcnet.com/measures/Rp_comp.html

http://www.vcnet.com/measures/

Charles Rauch, W8JI offers another viewpoint on VHF stability
http://www.w8ji.com/vhf_stability.htm

http://www.w8ji.com/Amplifiers.htm

5. Heath SB-200 Service Bulletins
http://www.fvh.accessus.net/~dwentz/heathkit/service_bulletins/heathkit-sb-sb200.txt

# 4769. Re: Isolating a "hot" chassis

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-22 02:34:11 UTC
From: Uncle Peter <radioconnectionNO@cox.netSPAM>
Message-ID: <an1Ta.16361$zd4.5437@lakeread02>
Source record: 30892

For the original S-38, which has a hot chassis and isolated
outer metal cabinet:

Be darn sure the chassis to metal cabinet AC bypass cap
is replaced with a UL line-bypass-rated capacitor to start with.

Second, replace the two wire cord with a three wire hot-neutral-ground
type. The AC switch should break the hot lead, not the chassis return
side of the cord. The neutral should connect to chassis, the hot lead
to the power switch--but make sure the set is wired to break the hot
side, NOT the chassis side of the line as done in many AC/DC sets.
Of course the green ground lead should go directly to the outside metal
cabinet.

Verify your house outlets have been wired according to code.

Enjoy the radio.

How about sending it by bus?

Most bus companies have parcel services that take packages up to 50 pounds or so and will get them to the destination faster than UPS Ground or FedEx Ground or USPS, for about the same rate I think (tho' I've never compared them)

We do that here in Montana for parts that one service tech needs and another has. It's not cost-effective to drive 100+ miles to deliver a part, so we put it on the bus. If you get to the station early enough, it will arrive at the destination in only a few hours. With all of the other operations it won't get there until the next day at the earliest.

Pack it yourself. Double boxed with peanuts in between.
Take it to FedeX and ship it third day. FedeX is much
more gentle and it won't get lost. You will be shocked
at the low prices for third day.

BTW: I was in the business. I owned one of those stores.

Rocky

There are times when shipping can't be avoided. California to Michigan? Yep- that would be one of them. Next time you buy something, consider just going and picking it up. There are many many advantages to doing this, not the least of which is you don't get into the whole packing thing and which shipper sucks the most on any given day.

Take one or two days off and get out and see the country. Take the spouse. Meet some really nice people. One time we drove from Michigan to southern Kentucky to meet someone who offered to drive up from northern Alabama. It ended up being just a super weekend and I new my new (to me) R-725 was not being used as a football.

It has also been my experience that people don't mind holding onto stuff for awhile as long as they know you will buy it. I'll send a decent size deposit (at least 25%) to hold it and the balance when I get there. This has worked very well. In one case in Maryland awhile back, it was several months before I was able to schedule the trip. Well worth it. One of the absolute highlights during 2002 was meeting Sam Timberlake down in Dadeville, Alabama. Sam's hospitality plus the down-home cooking would have been worth the trip just by itself.

Funny you should mention shipping Drake 4-Line gear...
I just shipped a C-Line station (TX, RX, PS, SPKR) to
a buddy in Pennsylvania from my home in north Texas.
He requested that I use the US Postal Service rather
than UPS or others. The cost, including insurance
and delivery confirmation, was about $18.00 per piece.
UPS and FedEx Ground would have been cheaper, but my
friend was paying the shipping costs, so he got to
pick the shipper.

I do my own packing using recycled boxes, bubble wrap,
etc, which I scrounge at work. I refuse to pay some
clerk at MBE or other vendor a lot of money to do what
I can do in 10 minutes at home.

I'm not offering any opinions on which shipper is the
best or fastest or most careful or anything else. I
am just sharing my recent experience (last week).

As for the cost, yep, it is getting high. I always
have the buyer pay the cost, and the buyer always gets
to choose their preferred method of shipment. If the
buyer doesn't want to pay the shipping, I find another
buyer. Simple as that.

Source record: 30806

Greetings.

I restored an S19R a couple of years ago and wrote an article about it. It is posted on the Hallicrafters Collectors International website at www.w9wze.org

Look in the "Restorations" section.

Fine radio for 1938. If you are going to keep it I would recommend replacing the electrolytic and a all of the old wax capacitors. It will then keep playing for another 65 years.

Doug Moore

Excellent condition Drake MN-2700 tuner with optional B1000 balun installed.
It has the sticky cabinet, but it is in good shape. Front Panal is great.
Included is the original manual Price is $375 plus shipping. Thanks,
Charlie Hugg, K5MBX

Hi,

Don't forget to enter the package size in the shipping calculator
so you get a correct quote.

Fedex ground is available you have an account with fedex.

Also when you ship using one of these package stores, the store
is the shipper, not you, so if there is a claim the package store has
to get involved to file the claim.

For larger items this is true.

USPS is cheaper for small items, BUT the USPS insurance is much more expensive. So sending a couple tubes Priority Mail can be a lot cheaper than UPS or Fed Ex but if you need insurance, we go back to Fed Ex being cheaper.

I doubt the pinout of the Globe will match directly that of the VF1.
Before you do anything, get a schematic of BOTH. Very likely
the voltages will be adequate from the Globe to properly run
the VF1, but odds of the pins matching up directly is zilch zero
nada. But easy solution - just map out each connector with
B+, Ground, and Filament AC on each connector - then get
a mating plug for each unit and wire the appropriate pins together
and make up an adapter. Should work like a charm - but just
verify the B+ requirements of the VF1 first - make sure the
Globe Scout supplies the correct voltage.

Do you really think you smoked the VF1? Open it up - most likely
you put B+ where it didn't want to go. There are few components
in a VF1 (comparatively speaking) - all that would smoke is a
resistor or two, and if you put B+ on the filament, you had a very
bright and expensive light bulb for just a microsecond.

But the VF1 should recover fine if you replace what smoked
and make the adapter. Hopefully nothing burned in the Globe -
the worst thing would be smoking its power transformer. but
highly unlikely.

Don't give up :-) GET SCHEMATICS!!!!

Good luck.

The cheapest way to ship anything is:

First you must box it yourself.
Second FEDX ground if you have a depot in you town.
Third USPO ground
Four UPS ground

If you must ship it Priority the USPO is the only way I go.

Yes the buyer always pays the shipping unless you have it figured into
the cost in the start.

Yes talk the Power Supply out of the MS-4 or the buyer won't be to happy.

Also double box the item and pack it real tight so it won't mover around
in the box.

Yes it is more work to double box but is almost better than buying the
insurance.

I never buy insurance unless the buyer want it.

I have never filed a claim on over 500 items shipped.

Last never go to the rip off places to have them pack and distroy you
item and end up paying through the nose for it.
Happy shipping

Ron

Thanks for your reply, ah6gi/4 - my answers to your questions are
below:

On 22 Jul 2003 01:08:08 GMT, <No Spam (ckh)> wrote:

<<snip

>I've been in the LMO.
>
>SB-400? You have a tube model.
>
>1. Tube is known good?

I have replaced the 6AU6 with another NOS one - no change in the
problem at all.
>
>2. What do you mean by 75 kHz high? Do you mean the output signal
>or the LMO as measured by a frequency counter is off?

Hadn't looked at the actual LMO signal, I was interpolating the error
from the actual carrier frequency of the transmitter. Checked with my
HP freq counter this morning - LMO is indeed 75 KHz high at the low
end of its travel, and linearity is off by +16 KHz at the top end,
referenced to the LMO dial.
>
>3. I found a cold solder joint on one of the temp compensating caps
>in a tube LMO. This was not on the wire to circuit joint. This was
>the little coil of wire soldered to the end of the cap's ceramic
>tube.

Might be worth opening it up and looking around inside for similar
faults - the problem isn't intermittent, and the LMO is stable even
when tapped with a screwdriver handle, so I hadn't considered a cold
solder joint.
>
>4. There is a known problem with dirty contacts between the LMO cap
>rotor and the spring clip. Cleaning instructions are on my page
>at http://www.kiyoinc.com/heathstuff.html

I'll do that while I'm in there - again, stability is OK, so I'm not
sure if this will do it, but from what I gather it will become a
problem sooner or later!
>
>5. How "pure" is the LMO's signal? What does a scope show you or
>how does it sound on a general coverage receiver?

On my scope, the LMO output is a pure sine wave (cleaner than any of my signal generators ever looked!).
>
>6. Check the voltages too.

B+ is within spec - there was a short from the original construction placing the wrong bias on the frequency shift connection (bet someone found this thing REAL frustrating to tune on LSB!) - that was fixed earlier in the restoration, though, and is not related to this problem.
>
>I'm guessing that you're close to getting it going.

Thanks - it's a fun unit to use (and would likely have been the one I would have had if I hadn't been lazy and got my ham kicense back when I first wanted to, in 1966....) - would be more fun if the dial matched the actual frequency, though!
>
>de ah6gi/4

I got scedmatics to both. The VFO was wired for a Viking 2.
The VFO has four wires.. red (HV), green/yellow and shield.
The pins on the Scout are 3(HV), 6 and 7 jumpered (I assume Filament) and 1
and 2 ground..
I wired it once and the VFO came on but no filament in the Scout.
rewired then smoke...
I wish they had instructions for these things..: P
Does'nt say why pins 6 and 7 are jumpered...how a VFO hookup is accomplished
with these pins jumpered.
Tossed it. I get another and try again...thanks..

Source record: 30820

I have for sale a nice Drake TR7 Transceiver and PS7 Power Supply. The TR-7 is a late one, SN 9283. It is loaded with all filters including the wide and narrow SSB filters, the CW filter and the hard to find AM filter. It has the non sticky cabinet which is very clean. This transceiver has been completely gone through in March of 2002 by John Kriner, The Man Electronics. He installed the latest mods including the Static Discharge mod and the mod that enables transmit on all bands including the WARC and 60 meter frequencies. He installed new bluing for the meter and PTO and other parts necessary to bring the rig up to 100%. He also performed a complete alignment. Documentation of this work in included. The PS7 works great. It has a small light installed on the front panel that glows red when the PS is on. Fans are installed on both the radio and the ps. This transceiver is equivalent to a TR7A except for the noise blanker. Original Manuals are included. Price is $675. Thanks, Charlie Hugg, K5MBX

It took a few weeks but I finally landed one (dow key relay) on ebay for
about $20 when I was looking for one. They are kinda pricey these days.
I'm not familiar with which type works with the Valiant...there are 6
volt, 12 volt and 110 volt ones as well as some more obscrure ones.
This should be in the manual???
If all else fails, make your own with a plain old radio shack relay of
the correct voltage.
Good luck.

Hi,
Could someone plse recommend a supplier of the old fashioned multi-section phenolic wafer switches, as have a broken wafer to replace in a multi-section band change switch.

I need a switch having 2 pole, 5 position wafers, with wafers being 1-3/8" (34mm) dia, with 1-1/8" (29mm) spacing between mounting holes on the wafer.
Any suggestions appreciated.

Dow Key still manufactures coaxial relays, but the're pricey--around $100 as of a couple of years ago. If you don't want to spend that much, check out places that sell used electronics equipment, or post a want-to-buy notice on line. You should be able to find a used one in good condition for about $30.

Ups the real story....

UPS sends all parcels to Louisville KY, to a place they called HUB 2K... The place is huge and mostly run by computers and conveyor belts (at One point I counted 14 stacked on top of each other and running in every direction) The conveyors do a number of things, like scan packages on all 6 sides, and dump and bump like you wouldn't believe..

A package comes into the hub on a huge cargo plane.,,, A device called a K-loader unloads two huge air cargo containers at a time ( oh and they have to use a jackstand at the rear of the plane as they unload or the plane could tip over) The container is set on roller plate (6 inch casters turned upside down) that allows anyone to move these huge containers with ease. The air cargo containers at locked in place in front of a movable belt that the employees (pretty much the only folks there) move (read toss) packages onto.... Heaven forbid your package gets on the bottom row of these containers. From there is off to the maze of belts and chutes where more employees repack your stuff into different air cargo containers.... The place is huge and busy.. How do I know I used to work for UPS (in phx) and have seen what and how they do business. Needless to say I use only FEDEX ground....

Oh and good luck with insurance claims (the horror stories I used to get when I mentioned I was a UPS employee... wheew .....)

This are my opinions only.... Make your own choices of carriers...
Bob

Thank you to everyone for good ideas and horror stories. I thought I would post a follow-up to my original post.

I have all three boxes packed and ready to go. Based on the anecdotal evidence you all presented, I am going to try FedEx ground tomorrow. But before I walk in there with my packages, I thought you might be interested in what I have in it already.

I know that as soon as I send this, someone (or more than one) will immediately reply with one of those, "NO! You should have done it this way!" messages, but I had few other choices. I'm just a regular guy that has to ship a few things.

I purchased at Staples:

(3) 18" x 18" x 18" boxes : $8.00
(3) 30-foot rolls of bubble wrap: $29.94
(4) 2 cu. ft. bags of packing popcorn: $27.92
(2) rolls packing tape: $5.30
+ 8.25% sales tax in L.A. county

That's right, $77.03 just to pack this stuff up. And I didn't even double-box it as some of you so adamantly suggested. Instead, I quadruple-wrapped everything in bubble wrap and floated it in a bed of packing popcorn.

I did not pass this charge along to the buyer. He is paying for shipping, though.

$77.03 represents 34% of my selling price.

I am not even counting the two trips to Staples nor the three hours in my garage lovingly packing it all up.

I learned a lot on this transaction. I really don't believe that it is worth shipping equipment. The next time, I will try to find a local buyer. No wonder the prices on e-Bay are so high.

Thanks again to everybody.

Al

Hi all,

Looking to swap a nice Icom 737A all mode HF transceiver for a vintage solid state or boatanchor transceiver, or AM transmitter...let me know what you have..This radio includes original box, manual, mic and accessories, and is at least an 8.5/10 condition..Works fine on all bands with full output..Only known issue is the auto tuner, which only works on 80 and 20, and is a common prob. listed on the Icom site..here is the link for a pic: http://www.dealamerica.com/737A.jpg

Thanks much,
Jeff W2NBC

Oh man, no offense but you could have saved about $75 just by picking up some old boxes and packing material. No doubt your stuff will arrive safe and sound but its easy to see why you are upset.
I buy and sell on a somewhat infrequent basis and have learned to save all the good boxes and packing material so I don't get hit with this kind of expense. At those prices it seems I have several hundred dollars worth of popcorn stored away in garbage bags :-) ...and never have had to pay for it.
Good luck with the remainder of the transaction.

Like GS said... you only have 2 voltages and ground to choose from.
Just measure them.....and hook-em up.
If you want to make it even easier...you can just hook up the filaments
first to verify they are lighting.
You could even hook the VFO to an external source of filament voltage just
to be sure it works (filaments light up).
In the 50's through 70's, novices were hooking up Johnson and Knightkit,
Heathkit and Hallicrafters VFO's to everything and everything. (Halli has
its own supply!)
Good luck!

# 4821. One more time...VFO and Globe Scout..

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-23 14:41:22 UTC
From: Jos <josuha15@yaho.com>
Message-ID: <vht6tomt2mr9fa@corp.supernews.com>
Source record: 30843

I have a Globe Scout and want to hook up a VF-1 to it..
The Globe has pin
#1..ground
#3 HV
#7 6.3 VAC
Pins #7 and #6 are jumpered...(6.3)
The VFO has 4 wires..
Red..HV
Yellow
Green
Shield (ground..)
I hooked it up and the VFO came on but the filament light in the Globe did not..
I reversed the yellow and green and it fryed..
Now...since there are no friggen instructions to this abortion and no one felt it necessary who built this thing to say how to hook it up, can someone please explain how to hook it up.
Does pins 6 and 7 stay jumpered?
Do I use all four wires on the VFO?
What the hell am I doing messing with this piece of crap when I could be having fun?
Why do I want to talk on this thing as there is no one to talk to anyway.
Forget it, I'm tossing the friggen thing and buying a computer...

Jos....
No instructions come with it because at the time (50's-60's), every ham could hook up a
VFO without even thinking about it.
I hate to say it, but if you are giving up so easily, perhaps you should put your ham license on ebay.
I don't mean to get you all bent out of shape, but it is one of those things that just takes some sniffing around.
I tried to look on BAMA for the schematic on the Scout. It would not download for me.
Anyway, I am guessing that the jumper on the Scout is the filament voltage. It is jumpered because nothing is connected to it and it simply is continuing the AC loop.
Disconnect the jumper, and measure those two pins with an AC voltmeter. If you get 6.3 volts, then you found the pins you need for filament voltage.
Yes, remove the jumper, Now the scout won't work because the filament voltage loop has been broken. When you hook up the VF1's green and yellow wires, you've reconnected the loop. Both radio and VFO's filaments should light. At the moment, forget about the VF1's red wire. That is the high voltage, and you can worry about that after you get the filaments lit.
I have a VF1, and its manual. If I can get BAMA to work, I'll look at the Scout wiring.
I'll let you know what I find out.

I fell victim to ebay. I bought a ts-820s with VFO. I just received it and the VFO/remote connector is mangled on the rig. No jumper was included. Are these connectors easy to find or am I SOL. Also, can I start it up without the mic? I need to purchase one of those as well.

thanks, Scott,

yikes! i should mention that i'm a complete neophyte with this
stuff...i'm not sure how to check voltage, or for that matter,
identify a control grid or cathode. there is a steady humming sound,
that doesn't seem to fluctuate at all, and it is not near any other
radio or tv. if i'm not mistaken, the 117n7 is designed to go directly
from an ac outlet without a stepdown transformer, isn't it? is my
household current too high? maybe a faulty tube?
thanks again,
Jon

Source record: 30751

Jos wrote:
> I have a VF-1 and tryed to hook it up to a Globe Scout. Pins 6 and 7 are
> jumpered on the scout for 6.3..
> Does the pins stay jumpered?..Nothing in the manual to show a hookup for
> it..
> I just smoked the VFO I think..: P

I looked at the schematics for both the Heath VF-1 and the WRL Globe
Scout octal sockets.

The VF-1 is as follows:
Pin 1 gnd
Pin 2 6.3V filament input
Pin 4 B+ input
Pin 8 in parallel with VF-1 keying jack for cathode keying of rig
Pins 3, 5, 6, 7 no connection

The Globe Scout is as follows:
Pins 1 and 2 gnd
Pin 3 B+ output
Pins 4 and 5 switched 120VAC (for antenna relay)
Pins 6 and 7 6.3V filament output
Pin 8 no connection

Caution: the B+ output of the Globe Scout is the full plate voltage
of the final tube (maybe 500VDC). I'm sure the VF-1 is expecting
a voltage more like 250VDC at its B+ input.
A hefty voltage dropping resistor is called for.

The two filament pins of the globe Scout stay jumpered.
Connect the VF-1 filament input to either Globe pin 6 or 7.

73,
Ed K4PF

Be a _REAL_ Radio Ham.

Manufacture your own from a bit of paxolin, with the wipers
and contacts re-riveted from another, incompatible wafer.

Thanks Greg. Had a good look, but no switch with the right dimensions there.
The switch was made in England in the 60's.

For small light items (10# or less) Priority Mail can't be beat, unless you have to insure it for a high value. Do buy the delivery confirmation, however. Fedex Ground generally beats UPS, but check the UPS site. I have found that my lowest costs come by scheduling a "1 time pickup" at my residence, actually get better rates that dropping off at their customer counter! YMMV
JohnL sends....

What do you mean 'fried'?
Did a resistor go up in smoke? or a tube go out, or a capacitor explode, or
the line chord melted, or the transformer burned and opened up??
What happened to the radio all depends on what fryed. By the way, did the
radio fry or the VFO?
When you hooked it up, was the other wire (red one) also connected?

Isn't that the truth Bill, remember the RCA Victor the wife had packed and
sent to you? You sent it back even better. Still have the box and all the
'cut out cubes' that were in between and against the tubes.

*Got all of it still. BTW Bill, that RCA is next to my bed hooked to an
awful lot of wire now. Gotta be over 700ft. it really hears at night on the
BCB and the shortwave bands. What impressed me is how well it hears on the
BCB 'during the day'. I have logged a station from Wyoming on that piece,
can you believe it...lol.

OK, I'm done. ;-)

The recession forced me to take a job for the first time in 10 years. I was lucky enough to get one last fall and even more fortunate to end up working with several hams, ham wanna-be's, and a fellow who ran an Air Force combat-comm unit in his last job.

We were knocking boat-anchors around the Pepsi machine, solving the world's problems and a couple things came up.

What's the most complex radio or piece of electronics that you've scratch built?

For me it was probably the Handbook two tube electronic keyer from the '60's. I've build a lot of kits and repaired stuff but most of my radios were commercial.

What is your favorite radio, if you could have only one, what would it be?

I'd probably say KWM-2A even though I've never owned one and likely never will. I have near-zero interest in modern digital, computerized radios. I like the SB-Heathkits because they are Collins knock-offs, good VFO's, easy to work on, etc.

I'm not an antiquarian, even though I'm in my mid-50's and was first licensed in 1963, I have a recent M.S. Computer Science (1992 - the George Washington University, School of Engineering and Applied Science) and hand build software for a living. I'm as state-of-the-art as they come, I just don't see the point of digital radios.

We talked about how the bands are "empty", nothing like they were in the '60s'. Even two is a wasteland, only a few QSO's going.

I suggested that we need something like Straight Key Night but for boatanchors. This might rebuild the interest in ham radio. The magic of older radios is that you can get into them and fix them.

You don't learn by harrumphing with the geezers on 75 meter LSB. I listen to them while I work on my Heathkits and some of that dag-nabbit'ing is embarrassing. I realize that at 55 (or is it 56), I'm closing in on my golden-years so I'll soon be there, 75 LSB.

I'm glad that they are on 75 meters, I just wish that there was more activity on the other bands, 10, 15.

We knocked around a few more concepts.

I'd like to see the bar lowered. The current entry ticket, the no-code Tech might be too high a barrier.

We discussed something like the old Novice theory and no-code for 2 meters and 40, 15 meter CW and 50 kHz of 10 meter SSB, 100 watts.

Current no-code tech's grandfather to some HF priviledges and retain all the current tech freqs.

Tech-plus and General become Generals. Just upgrade them in the computer. So Tech-plus gets HF SSB.

Advanced is grandfathered.

Extra stays the same but for the life of me, I can't get over the concept of a 5 WPM, question-pool Extra. I say that as someone with FCC 13 WPM and the original Advanced theory exam. I'm shaking my head ruefully.

But that's half the problem. The other half is getting folk talking on the air and working on their radios because that's how they learn.

I don't think that reading the spec sheet on an ICOM counts as intellectual stimulation or a technical challenge. I do have an ICOM multi-mode, synthesized, computer controlled radio. I've used it for a few hours.

So here's our concept.

Boat Anchor Weekend - a contest like any other but you get multipliers for operating older radios. You get double points for contacting stations that are more than 25 years old. Perhaps QCWA would sponsor a Quarter Century Radio Night. Any 24 hours in a weekend, multipler of 1 for 1990+, multiplier of 1.25 for 1980-1989, multiplier of 1.5 for 1970-1979, multiplier of 1.75 for 1960-1969, etc.

The older your rig, the more multipliers you get. Max is 3X for 100% homebrew.

Multiplier of 1 for digital readout, multiplier of 1.25 for analog readout. Multiplier of 1 for solid state. Multiplier of 1.25 for all vacuum tubes. Rectifiers don't count. Final tubes only count as solid state. Outboard digital readouts can be disabled.

Hybred stations, say a vacuum tube transceiver and a solid state linear, lose the vacuum tube multiplier.

Station age is determined by the age of the youngest major part. An HT-37 and a new ICOM R-70 receiver is a new station, no multiplier.

The point is to get the older, more interesting, radios working.

Boat Anchor Weekend, Quarter Century Radio Night, stations lit by vacuum tubes, ...

"Rig here is a 1960's Heathkit SB-101 so you get 2 points... "

"That old Heath sounds good, I'm running a 1960's Drake 2B and an HT 32, 2 points for you too."

If we keep the boatanchors going, make it a national activity, we can rebuild the original interest in Ham Radio. We're competing against the Internet and 160 channel cable TV. Isn't it better to get kids of all ages into hamming????

Source record: 30775

I have for sale a nice Drake TR7 Transceiver and PS7 Power Supply. The TR-7 is a late one, SN 9283. It is loaded with all filters including the wide and narrow SSB filters, the CW filter and the hard to find AM filter. It has the non sticky cabinet which is very clean. This transceiver has been completely gone through in March of 2002 by John Kriner, The Man Electronics. He installed the latest mods including the Static Discharge mod and the mod that enables transmit on all bands including the WARC and 60 meter frequencies. He installed new bluing for the meter and PTO and other parts necessary to bring the rig up to 100%. He also performed a complete alignment. Documentation of this work in included. The PS7 works great. It has a small light installed on the front panel that glows red when the PS is on. Fans are installed on both the radio and the ps. This is a nice, clean transceiver.
It is equivalent to a TR7A except for no noise blanker. Original Manuals are
included. Price reduced $50 to $625. Thanks, Charlie Hugg, K5MBX

# 4856. i need rohn 25 tower

Newsgroup: rec.radio.amateur.boatanchors
Date: 2003-07-24 23:28:01 UTC
From: Ken Harris <k5kdi@cableone.net>
Message-ID: <vi0qseaeus9o54@corp.supernews.com>
Source record: 30779

i am in need of more rohn 25 tower, doesnt have to be perfect, just decent, and safe.....
i have the following to trade, and might can drive around 100 or so miles to deliver/pickup....

for trade:
a heathkit dx-100 AM transmitter, working perfect, havent taken pic of this one yet.

a hammarlund hq-100 receiver, works good, and i have pictures.

2 or 3 eimac 4cx1000k tubes, with eimac info, a deal is in the process for one or two of theseso contact me if interested.

a sure 444 desk mic, wired for kenwood, in great shape....

a dentron dtr-1200L hf amp,VERY RARE FIND!
i have used this as a play amp for projects, i have all the original stuff , it originally
had 2-572b's in it, right now its ready to go as a single band amp, but it has no tubes, cause a "buddy" borrowed them and messed them up, i beefed up the power supply with larger diodes, now it has the power supply of the clipperton-L.

a D&A hornet 10-40mtr 100 watt tube type amp with sweep tubes.

a sonar 10 mtr amp, tube type at 100 watts with ubes.

a murray 20 horsepower twin cylinder industrial riding lawn tractor with automatic transmission, and good tires, good shape, i use it weekly, buts its just too much for my little yard i have now, was over $1400.00 a little over a year ago at the local home depot. and am looking to sell it at $900 cash, or $1000 trade.

ALL of its parcels? The last five shipments that I have received
and/or sent have never been east of the Mississippi River, and
even those from "the East" never got anywhere near Louisville.

Or is the tracking record lying to me?

Nah, it's not lying as far as I can tell. Ground shipments seem to go
direct, pretty much... they arrive too fast to have been shipped to
Louisville unless they were sending 'em by air rather than by truck.

Now, it's quite possible that packages which are sent next-day-air are
shipped to one or more large dispatch hubs, and then shipped out again
from there. I recall hearing that Federal Express used this approach
with its overnight-delivery service... they'd fly everything back to
one big hub (arriving by late evening), sort it, and fly it out again
to the destination city in the wee hours. This approach probably
required a lot less individual airplane routes than would be required
to allow for direct city-to-city shipment.

I know they don't send "all" parcels to Louisville.. they certainly don't send local shipments there. We used to get Double O Electronics to ship to us in Newberg same day all the time.. if we caught them early in the morning, before pickup, we would have the parts that afternoon, around 2:30 or so.

This was a key part of FedEx's original business plan for overnight
delivery. I heard that the founder of FedEx got a "C" for this plan at
the Harvard B School, but I'm sure he's gotten over it.

Hi, Frank,

Welcome to the wonderful world of boatanchoring.

I have several Johnson radios, and have had several Valiants over the years. They work very well, and you should enjoy it a lot.

There is a dowkey relay on eBay right now, currently at $29. This is about right...probably will go for about $40.

You need one with external contacts, as you want to mute your receiver when transmitting. You'll want one that is wired for 110vAC. This is the common voltage for the older receivers, such as Hammarlund, Hallicrafters or National. I'm assuming you'll be using an older boatanchor receiver as well.

You don't actually have to have a changeover relay. All older receivers have a standby/receive switch on them, and you can manually mute your receiver when transmitting...a changeover relay is just more convenient, however.

Here is the eBay URL;
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3036764365&category=4671

Good luck,

Larry, N0XB
Northfield, MN

The line in your post that I picked up on was, " Boatanchors
deserve to be left as found if they can't be properly retored," and I
guess I read more into it than was there.

Actually I was looking for a better back and bottom cover for one that
I already have, so the knobs don't matter. Anyway, they will be red.

Phil

Perhaps they were referring to "their" local hub. Our hub just happens to be New Stanton PA. I track all packages when they leave here and not all go the same route. I've never taken the time to track Postal Shipments.... I do know the one time I did, it showed a point within the City of Pittsburgh. But that package was going North East. It would make sense... Not sure if the mail went from the city to a plane or what....

As to shipping costs, packaging yourself saves bundles. If you look around, you can find supplies to do the job. Also, when you GET packages, save some of the stuff (boxes, foam, etc) for future use. For bigger boxes, go to some of your local stores. Some will give up boxes, some won't. Appliance stores can be a good source. The box can be bigger, but you don't want it too big. Just enough room for some packing on bottom, top and sides. If the box is too high, cut it down and fold it in. The flaps will also add cushion to the top. There are a few stores here that sell shipping tape CHEAP. $1 a roll, usually enough for a few packages. On some occasions, I use Masking tape as well.. It is $3 a roll, and again, enough for several packages. Newspapers - if you or your family or neighbors read them, save some. Supplies to ship do

NOT have to cost a bundle! As to rates.... SHOP.... In my business, I do a lot of shipping. Often I find either UPS or Postal to be cheaper than the other. Depending of course on the size and weight AND destination, sometimes the difference is anywhere from a $1 to $5 or more. If only a $1 to $5, you must consider this as well... If you have to travel any distance to a UPS site, would it be worth the $1 - 5 OR just as convenient to go to the nearest Post Office? That has to be a personal decision. I pack the unit, weigh it on a scale and insert the dimensions "to the nearest inch". I've often been right on the money but not more than $1 off in my figure based on scale accuracy compared to the scale at point of shipping.

I've NEVER had a problem with a lost or damaged shipment to date with any of my shippers, contrary to others who seem to have developed a hate for one or the other for claims of such. PACKING is a HUGE issue here. IF it is packed well, it should survive most anything. I've sent some rather heavy items out and still, they made it with out incident. In those cases, I've double to triple boxed them. Yes, it adds a bit to the weight, but if you want it there in one piece, a little extra is what it is going to take. IF you're willing to buy or sell an item of value then why cheap out on the shipping to get it there????? PACK IT TO ARRIVE IN ONE PIECE - Then go on line and get the cheapest quotes you can find. Packing and shipping is NOT rocket science. I've seen many many complaints of shippers damaging goods, losing them, and the cost thereof to ship... MAYBE if I have a problem I'll see the other side of the coin. To date, I have not and therefore do NOT see what the big deal is.

The ONLY time I ever "supposedly" had a package lost, was in shipment to me... I paid $150 for it with shipping... It never arrived. I called the company I bought the item from. They said it was shipped, but they could NOT provide a tracking number even though they said they kept such records. They couldn't find it. All the sudden, it was the "shippers" fault for not giving them a tracking number for their files. NAH, I don't think so. The item was also supposed to be insured, again, they had no "receipt". Hmmmm. I told them, if I did not receive the item in 2 weeks tops, I was going to file charges. It took 3 days, I had a certified check in the mail. Payment in FULL. I had already looked up the State Attorney General's web site for that company, sent them an e-mail and forwarded a copy to this company.

I had one other occasion... A man across the country from me, bought an item from me on E-Bay. He said he sent payment out lets say for example May 25th 2003.. "I" should have seen that Money Order in 3 days - usual mail time for cross country to me... I waited a week and a half. I told him it didn't arrive. Right away, he accused me of ripping him off. I told him to have it traced if he desired. He said ok, we'll see who's signature appears. Well as it turns out, the Post Office requires 30 Days before tracing. ON the 30th day, believe it or not, I DID receive the envelope. True to his word, the MO was bought the day he said. Was it mailed that day????? The stamp on it suggested otherwise. Was it in a mail box all that time, then dug out, stamped and put in system??? I don't know.
But I did take a picture of the envelope with the cancellation stamp showing and e-mailed it to him, then placed the item he bought, in the mail. SO,

what I'm saying is, honesty counts a lot and if payment was actually sent. "I" ALWAYS offer to send an e-mail picture showing the receipt of a Postal MO, copy of a check to that party, whatever. If it will cover MY ass, I DO IT. It IS worth the effort. I've learned not to leave anything to chance. I go by Murphy's Law when doing anything. It saves me more time than not. AND aggravation in the end.....

The only other problem encountered was a shipment from Alaska..... It took over a month to get the package. It took 8 days for the MO to get there. They must use dog sleds or something. Not sure of the problem, but mail from there in "package form" SUCKS for time. At least in MY case.

It boils down to packing, cost analysis for shipping, honesty of the shipper and buyer, clogs in the system!

I hope this has helped.

JMS

Leaving aside the question of radios feeling either embarassment or misery, whoever owns the thing is free to do pretty much what he wants to do with it. Considering the number of nice original S-38s out there, it doesn't seem worthwhile to bring that one back to something like it's original appearance. I have an original S-38 with the BFO and steel bottom. The paint's all scratched up bad, much of the scratches across the lettering. I think it would look much nicer chrome plated.

Then I'm guessing that there is *one* bad cap or bad solder joint in
the LMO. I don't think that adjusting the trimmer is a good idea.
I'd especially avoid even thinking about touching the plates on the
tuning capacitor.

If you can get a schematic for LMO, you might be able to "calculate"
the cap that would shift the freq by that amount.

When I had the cold solder joint on the temp compensating cap, the
symptom was that the LMO freq would jump about 20 kHz during
operation.

I found it by listening to the XTAL calibrator on the receiver and
pushing on the caps with a diddle stick. One cap made the freq jump
and jump back.

As I said, I think you are close to finding the problem.

Yeah, that's right. I was on an extended assignment doing a long consulting gig for UPS in the mid-90s. UPS is the nation's fourth largest airline, in terms of number of aircraft. Once everything is flown in and sorted, it goes out of Louisville in an incredible event known as the 'Midnight Flight' or some such thing, wherein in the middle of the night, plane after plane takes off for its destination. It is a sight to behold. You stand there on the tarmac and you watch endless takeoffs that go on for *hours*. Endlessly. In the middle of the night. It is surreal.

The guy I bought it from already did a ton of work on it: He reconfigured it so it now uses a common 5Y3 rectifier. I think the original was a type 80 or 81, not sure. He added a fuse to the AC line, changed 2 AF coupling capacitors, replaced the standby switch, and replaced the speaker. Also new is the power transformer and filter caps. He also (get this) rewound the Broadcast Band antenna coil!! By hand!! This fellow is very meticulous, I must say. Thanks for the link, I'll check it out.

Recently acquired a nice TS-930S but I suspect a previous owner had turned the RF power output down somewhat as I only get between 80-90 watts out of the rig. I believe the rig is rated at 230 watts input and have been told the RF output should be around 130 watts. Can someone tell me where/what pot to adjust to increase the RF output ? I did not get an owners or service manual for the rig. I have ordered an owners manual but suspect it will be some time before I get it. Any help would greatly be appreciated.

Lafayette HA260 2 meter linear amplifier, dating from the mid 60's.

5 watts in equals 60 watts output. Uses Amperex p-p beam tetrode in final, transistorized inverter. Runs on 12V DC. Originally used as an amp for a Lafayette 2 meter AM rig. Will work on AM/SSB/CW/FM. RF sensed T-R changeover.

Excellent condition, one odd knob on the front.

Asking $50, or make an offer.

Shipping FOB St. Joseph, MO 64501

I think it's fairly normal, and an indication no one has been messing
with it.
A friend of mine had a 930 back when it was a fairly new radio, and he
told me he only got 80-90 watts from his. He was a very good tech and
was able to work on it, so I know there was nothing wrong with the
radio. By running at that level, the signal is very clean. If you
crank it up, it gets nastier, and if you totally defeat the alc, it
will trash out. Myself, I wouldn't worry about it.
You can't tell the difference on the air if you did crank it up. A
small fraction of an S unit. Both my icoms barely do 100w. Many times
only 80-90 watts being I'm battery powered on those radios. MK

When the DSL gets saturated... it happens when too many people try to visit at once. It happens to me alot here at the server end of things. A T-1 line, which I am too cheap to pay for, would not really alleviate things under
such conditions. A T-3 would, though.

The VMS+Apache server keeps running, but your HTTP request is extremely delayed until your browser times out.

It's like trying to get 15 people into a telephone booth. you reach a point where no more can squeeze their way in, and the remining ones wait or begin to walk away.

Probably some leeches are sucking down the entire set of documents. It is usual in such cases and they are welcome to them. Looks quiet now.

Just try again later, it is always running. It's OpenVMS after all!

I did by the way, change the 'large' file sizes to slightly smaller size of 1500 wide, and eliminated the hard to read 'web size' files. I hope this is a good compromise. The 300DPI were just too large, (data-wise). I resampled
the original 300DPI files and resized from about 2500 wide to 1500 wide. I also re-sampled the 'thumbnail' images to a larger size to make it easier to tell what is on the page. It's not perfect but nothing is.

I have equivalent numbers of stancor, triad, chicago, and thordarson catalogs waiting. It took 3 weeks to do the UTC catalogs. I'll post notice when I get more up.

Thanks for looking!

It's semantics at this point, the AM studio is perfect if it is limited to about 5KHz, something which is quite a different case than an FM studio or a recording studio.

Can you find this data for me? I am very interested, it might shed more light on the subject. I understand it may be hard to find today.

Since SSB has no carrier, you can shave the bandwidth a little closer by getting rid of the lower frequencies. With AM, you may as well use the lower frequencies if you want, since you have a carrier at 0 Hz so to speak. 2.4KHz
bandwidth on AM voice sounds a little muffled to me, and to me, 3.0KHz or (very) slightly more, is much more readable, especially when there is alot of noise. Everyone hears differently in some respect, maybe I have hearing
damage. In amy case I am not advocating more than 'necessary', but I do have trouble with speech signals that are cut off too sharply. I always tune my SSB receiver so that the

voice is higher pitched than natural, then it is
easier for me to hear. It doesn't work with AM that way, the tuning.

just as an example,
2.4KHz ssb = 300 to 2700 Hz audio.
+/-2.4KHz AM = 0 to 2400 Hz audio.

I can't remember what volume I read it in so take it with a grain of salt, or a whole bag of salt, but I recall that for good intelligibility and having a signal that does not tire the operators, there was some mathematical
relationship between the highest and lowest audio frequencies to be reproduced. Anyone remember that? I regret I cannot quote the source. Maybe there is a some experimentation to be done. I would like to see a reprint of the
Bell studies.

But anyway, here are my sources to support the freedon to employ at least some leeway for bandwidth in the matter of communications quality AM. It's definitely your right to interpret them how you wish:

==========
"Understandable speech requires the reproduction of all
frequencies from about 250 to 2700 cycles, or sideband
frequencies ranging from 250 to 2700 cycles above and
below the carrier frequency."

FROM: "RADIO ENGINEERING", second edition, 1937, chapter 9,
section 72, page 396, "Waves with Amplitude Modulation",
Frederick Emmons Terman, Sc.D., Professor of Electrical
Engineering, Stanford University.

MY Opinion: Mr. Terman's text says 'requires',
therefore this is taken as the minimum requirement for
speech to be 'understandable'. This does not necessarily
imply good communications quality, but rather
'understandability'.

==========

"Modulation frequencies Corresponding to Typical Signals
(minimum frequency range that must be met)"

"Long-distance telephone quality.......250-3500 c/s."

FROM: "RADIO ENGINEERING", third edition, 1947, chapter 9,
section 9-1, page 469, table 9-1 --Modulation frequencies
Corresponding to Typical Signals (minimum frequency range
that must be met)., Frederick Emmons Terman, Sc.D., Professor
of Electrical Engineering and Dean of theSchool of Engineering,
Stanford University. Past president, Institute of Radio Engineers.

My Opinion: Please consider the audio quality of long
distance telephone service in 1947.

==========

"...For ordinary SSB telephony, M=3000 Hz. .."
"...For high quality SSB Telephony, M=4000Hz. ..."
"...For ordinary DSB telephony, M=6000 Hz. ..."
"...For high quality DSB Telephony, M=8000Hz. ..."

FROM: "THE RADIO MANUAL", fourth edition, 1950, appendix 5, page 859, "Table of necessary bandwidths", George E. Sterling, Commissioner, Federal Communications Commission, and Robert B. Monroe, Radio Engineer, Columbia Broadcasting System, D. Van Nostrand Company, Inc. 4th edition, 1950.

==========

"Frequencies up to at least 2,500 cycles, and preferrably 3500 cycles, are necessary for good speech intelligibility."

FROM: "RADIO HANDBOOK", fourteenth edition, 1956, chapter 12, section 12-1, page 225, Editors and Engineers, Ltd., edited by William I. Orr, W6SAI.

==========

"...Mediocre reproduction may be restricted to 100-5000 c/s., while many radio receivers are limited to 100-3500c/s. It should be remembered that the frequency range is taken as overall, including the loss of sidebands and including the loudspeaker. Wide frequency range is only comfortable to the listener so long as other forms of distortion are negligible."

FROM: "THE RADIOTRON DESIGNER'S HANDBOOK, THIRD EDITION", 1941, chapter 5, page 32, "frequency distortion", THE RADIOTRON DESIGNER'S HANDBOOK, THIRD EDITION", F. Langford Smith, S.SC., Member I.R.E, M. I.R.E., A.M.I.E.E., A.M.I.E

> and have been told the RF output should be around 130 watts. Can
> someone tell me where/what pot to adjust to increase the RF output ? I

Adjust VR8 for 110 watts output. VR8 is on the main signal board,
underneath. Locate it as follows: With the radio upsidedown and the
front panel toward you, look to the left of center of the board,
slightly toward you. Locate connector 5 (8 pins). Directly above (away
from you) is a pot. Directly to the right of that pot is VR8. To
verify, VR8 has a pot directly to its right and one directly toward
you.

Brian

Source record: 30721

I have for sale a nice Drake TR7 Transceiver and PS7 Power Supply. The TR-7 is a late one, SN 9283. It is loaded with all filters including the wide and narrow SSB filters, the CW filter and the hard to find AM filter. It has the non sticky cabinet which is very clean. This transceiver has been completely gone through in March of 2002 by John Kriner, The Man Electronics. He installed the latest mods including the Static Discharge mod and the mod that enables transmit on all bands including the WARC and 60 meter frequencies. He installed new bluing for the meter and PTO and other parts necessary to bring the rig up to 100%. He also performed a complete alignment. Documentation of this work in included. The PS7 works great. It has a small light installed on the front panel that glows red when the PS is on. Fans are installed on both the radio and the ps. This is a really nice, clean
transceiver. It is equivalent to a TR7A except for no noise blanker. Original Manuals
are included. Price $595. Thanks, Charlie Hugg, K5MBX

Tim -

I believe that the TS-930S uses the MRF-422 RF bipolar transistor (28 volts and 150 watts out for 15 watts in).
Kenwood service bulletins suggest the usage of the "Low Beta" MRF422 (Orange/Yellow)
RF transistor be used in the TS-930 transceiver.

So, you ask, what is this "beta" thing?

Generally speaking, RF power gain (Pg) and Maximum Saturated Power Output (Po) will be higher with "High Beta" parts, however, amplifiers and transceivers using
"High Beta" parts will tend to be less "rugged" and may require additional stabilization (e.g. additional components and circuitry).

Motorola® uses two methods to designate d.c. current gain (Beta) of popular
RF Power Transistors;
"Color Dot" and "Letter Code". (Note: some transistors may not carry the
Beta test code.)
Motorola beta coding (colored dots)

http://www.rfparts.com/tranmatch.html

You may wish to double check the service notes for the TS-930 on the Kenwood web site

I believe that there are 15 Kenwood bulletins for this transceiver model

Source record: 30730

I'm playing with an old FT 101B Yaesu. After a few repairs, I've only one problem left to solve.

The transmit frequency is not aligned with the receive frequency. The difference is roughly 700Hz on all bands and modes.

I've only got a copy of the operating manual and the possiblity of this problem and a solution are not addressed as far as I can tell.

It seems I remember folks having this problem with 101's back in the seventies, but it's a very vague memory.

If you know the fix for pulling this together, or if you can point me to it on the web, I'd appreciate it.

I figure it's in the service manual, but I'd rather not spend $41 if I can help it.

Thanks for the read!

From: Brian <hamster@atmc.net>
Message-ID: <bg1v9k$ove$1@news3.infoave.net>
Source record: 30731

I recently got a good deal (five bucks) on a "ten meter" amp with two 6LQ6 tubes (no, I don't intend to go below 28.3 mHz with it). It seems to work, more or less, but I was wondering something.

At about 28.5 mHz, it puts out 43 watts with 4 watts driving it on AM (using a CB converted to 10 meters). Is this normal, or are the tubes getting soft? I understand a pair of 6LQ6 tubes are rated for a lot higher output, but I don't know how much I can feed into it without overdriving it. If I feed in 7 watts AM or 25 watts SSB with an HTX-10, will I earn the splatter award of the year?

Thanks.

Brian

---
I'd like to make a few comments about this.
1. AM does not necessarily have two sidebands. The same "quality" is had with SSB AM and DSB AM, and SSB AM uses half the spectrum.

2. If the transmitted audio passband is 400 to 2800 Hz (2.4 kHz), the receiver passband still needs to be 2.8 kHz for correct demodulation. That is, the demodulation carrier must have the identical relationship to the sideband that existed at the transmitter.

3. During WWII the Bell system used as little bandwidth as 1.6 kHz in their long-haul channels. The quality was very poor, but you *could* communicate. Modern telecom channel bandwidth is about 200 Hz to 3450 kHz. Generally this is called a 3500 Hz channel. In ham radio that bandwidth provides good fidelity for speech. With anything less it becomes increasingly difficult to recognize who is the speaker. Using narrow band receive filters (1.8 to 2.4 kHz) improves the ability to communicate by eliminating or reducing QRM/QRN, but the quality is reduced by this.

4. Ma Bell's studies on fidelity got into the perceptual area of balance between the low end and high end of the audio spectrum; Having lots of bass without good treble, or good treble without good base did not sound good. That's one of the big reasons that the low end of the telecom voice channels don't start at 100 Hz or lower. I thought I had a copy of the study, but couldn't find it.

I would like to see hams who like AM migrate to SSB AM and limit the audio passband to 3500 Hz. For carrierless SSB 3500 Hz should also be the passband limit.

Don

>SSB AM and DSB AM, and SSB AM uses half the spectrum.

Who cares!

"AM" does not necessarily mean... a *lot* of things. But since
SSB AM is basically unheard of for voice communications on HF,
why would I bother considering it? Clearly I meant standard DSB
AM, and there is also clearly no point is even discussing SSB AM.

>2. If the transmitted audio passband is 400 to 2800 Hz (2.4 kHz), the receiver
>passband still needs to be 2.8 kHz for correct demodulation. That is, the

In an AM receiver the passband needs to be at least twice the
highest frequency of the transmitted audio passband. Hence,
*not* 2.4 KHz receiver bandwidth, but 5.6 KHz for AM.

>3. During WWII the Bell system used as little bandwidth as 1.6 kHz in their
>long-haul channels. The quality was very poor, but you *could* communicate.
>Modern telecom channel bandwidth is about 200 Hz to 3450 kHz. Generally this
>is called a 3500 Hz channel. In ham radio that bandwidth provides good

Modern telecom circuit bandwidth actually ranges from, at best,
about 80 Hz to about 3750 Hz, to at worst the stated 400 Hz to
2800 Hz. In fact it is *specified* as 400 to 2800 Hz, and that
is what circuits, as opposed to channels, are tested at.
(However, these are *not* 6 dB points either. That is a +1 to
-3 dB point, so the commonly used 6 dB points will be something
less than 2800 Hz.)

In the telecom industry it is not called a 3500 Hz channel. It
is commonly called a 4 KHz channel, even though the bandpass
never approaches 4 KHz. The reason for that is historically, in

analog Frequency Domain Multiplex systems, each channel was
assigned a 4 KHz slot in the carrier baseband.

Today, with digital carrier sampled at an 8 KHz rate, it is
still technically a 4 KHz channel (the Nyquist limit) in the
same sense.

However, modem design engineers, as an example, do consider it a
roughly 3500+ Hz channel, being typically 100-3750 Hz at best
through equipment over which they expect their modem to function
at its peak performance. Of course there are a lot of channels
(ADPCM, DAMA satellite channels, and long cable loops) which
simply do not provide any better than the 400-2800 Hz bandwidth
mentioned as the minimum specification. Hence if you want to
make reference to a 200-3700 Hz channel, don't call it a typical
telecom channel, which it isn't; call it a typical 64 Kbps PCM
digital carrier channel, which it is.

>fidelity for speech. With anything less it becomes increasingly difficult to
>recognize who is the speaker.

Recognizing the speaker is not necessary, and typically for the
past 20-30 years or more SSB filters have been from 2.1 to 2.8
KHz. Anything wider is relatively _rare_, which suggests that
your call for wider bandwidth of clearly overstated.

Has even a single manufacturer marketed a ham HF SSB transmitter
using more than 2.8 KHz bandpass filters in the past 25 years?

>Using narrow band receive filters (1.8 to 2.4
>kHz) improves the ability to communicate by eliminating or reducing QRM/QRN,
>but the quality is reduced by this.

How can you say the quality is reduced but the ability to
communicate is improved? That is contradictory. The *purpose*
is communications, and whatever improves the ability to
communicate is an improvement in quality, by definition.

>4. Ma Bell's studies on fidelity got into the perceptual area of balance
>between the low end and high end of the audio spectrum; Having lots of bass
>without good treble, or good treble without good base did not sound good.
>That's one of the big reasons that the low end of the telecom voice channels
>don't start at 100 Hz or lower. I thought I had a copy of the study, but
>couldn't find it.

The low end *does* start at 100 Hz or lower! Typically it
starts at 80 Hz. (The reason for that is the existence of a low
pass filter to reduce 50/60 Hz power line influence.)

At the opposite end, prior to digitalization the VF response must
be filtered to reduce a 4000 Hz signal at least 14 dB below an
equal level 1000 Hz signal at the input. Typically the effects
of that filter can be seen from about 3750 Hz and above.

Those are individual channel characteristics for typical 64 Kbps
digital carrier systems. An end-to-end Voice Frequency circuit,
however, is still only required to meet specifications at 400,
1000 and 2800 Hz.

>I would like to see hams who like AM migrate to SSB AM and limit the audio
>passband to 3500 Hz. For carrierless SSB 3500 Hz should also be the passband
>limit.

A more realistic bandwidth is between 2.4 KHz and 2.8 KHz, and
it seems that in recent years the lesser of the two has been
more popular.

I doubt if many AM broadcast stations have studios that are
limited to 5KHz, any more than an FM station would. They
don't commonly go to the effort that a recording studio does,
but they certainly do not restrict fidelity to 5 KHz audio.

I don't know where you'd be likely to find it. Perhaps in a large
science library.

>Since SSB has no carrier, you can shave the bandwidth a little

You are talking apples, while I was talking oranges.

"There is no difference at all between the audio
response necessary for SSB and AM."

Audio response, not bandwidth. Clearly the bandwidth required
to get the same response is different for different modulation
schemes.

>respect, maybe I have hearing damage. In amy case I am not
>advocating more than 'necessary', but I do have trouble with

You would enjoy using the old Drake receivers, with a tunable
IF bandpass filter. You could locate the bandpass anywhere in
the audio range that suited your ears. (I also have hearing
loss, and when I was young I enjoyed music with a lot of bass
boost, while today I want the treble cranked up!)

But that does not say anything about what is required for
communications. It just says what was provided by Ma Bell
in 1947, which is *not* something that was specified as the
best for communications (over a single channel).

The 250-3500 Hz range was what L carrier (over either coax cable
or what was then the newly designed and soon to be implemented
TD-2 microwave systems) provided on a per channel basis. But an
actual circuit connection was expected to be implemented with
_multiple_ tandem channels... and the ultimate circuit
connection provided was (and still is today) specified at 400 to
2800 Hz. (And believe me, too many L carrier channels in tandem
could make 400-2800 look good!)

The quality required end-to-end was a 400-2800 Hz channel
(with an SNR of 24 dB or better).

>System, D. Van Nostrand Company, Inc. 4th edition, 1950.

Obviously that is in very round numbers and it does not
appear they meant them to be take as a specification.

In 1950 *nobody* expected to get such (4KHz audio) a "high
quality" signal over *any* long distance facility.

>DESIGNER'S HANDBOOK, THIRD EDITION", F. Langford Smith,
>S.SC., Member I.R.E, M. I.R.E., A.M.I.E.E., A.M.I.E

That doesn't seem to apply to the subject at hand. It doesn't say anything specific, but it does touch on one point that does need to be considered: The amplitude distortion requirements vary with the amount of other types of distortion or noise.

Hence processed audio might need less bandwidth to be effective, and otherwise distorted audio might need more bandwidth to be effective.

I looked through the texts that I have (virtually all telecom related, as opposed to radio communications in general) and did not find anything useful. I was struck by one odd thing that is interesting though! Everything I found was concerned not with audio bandwidth, but *only* with reduction of the RF bandwidth... by finding better ways to encode that imaginary 0-4 KHz telephone channel into a digital data stream that uses less bandwidth when it modulates an RF carrier.

Maybe we are all barking up the wrong tree, and should instead be considering ways to use digital technology to put more signals into the same HF bandwidth?

In my book, page 11, there is a layout of the underside adjustments. The diagram shows all the "lettered" adjustments and their location(s). It would appear that you don't have that page or the same manual I'm using. Maybe the following will help:

Looking at the chassis bottom with the pwr xformer positioned to be in the upper left, the adjustments in the center 3 shielded areas are:

top C G T Q K O (inductor)
center B F S P J N (inductor)
Bottom A D E H R L I (left inductor) M (right inductor)

Right side of chassis, top to bottom: 5 top can X center can, U bottom can

Any help??

Floyd,

I think it all boils down to this, if you want to limit the frequency range of your radio to whatever, because you believe that you like it best (or whatever) great! It is your privelege to do that. As for me, I think that a little wider is nicer and that's OK for me too. You may believe strongly in your justification but the rules give very wide lattitude in making this call to the amateur. Some may think this is about to change but I don't think so. So good luck and have fun. The hobby is great, isn't it!

By the way, in the discussion of bandwidths, your hyperbole is totally without meaning if you are not specifying attenuation at the given limits of bandwidth. 100 to 3500 hz is a very different spec if those are 3 db points than if they are 26 or 60 db points. Also specifying that the limits refer to peak or average would be helpful in making your comments meaningful.

Besides not even a moose would take his call at being real with those kinds of limits. You're up there, go ask one!

hi all,
Looking for two control knobs for my ra17. They are one for the AE. RANGE switch, and one for the BFO NOTE.
One good piece of news is that W H Westlake has the worlds stock of Burndept connectors for the ra17, and other items, both m & f.
Large new £2, Large s/h £1.
Small £1.

Thanks for your help.

Tim

No. You can use a filter of the same bandwidth as the audio signal and offset
the IF frequency or retune to pass the carrier and one sideband.

I did not suggest that there should be a regulatory limit. That
came from elsewhere. My argument is purely one of technical
aspects that have to be considered.

However, if you and others insist on ignoring the appropriate technical
aspects, we *will* see regulatory action to curtail it.

Yes, and I could write a fucking book too. What's your point?
The only time any specs that I meantioned deviated from the
standard ones, I mentioned not only that it did but what the
effect was.

>Besides not even a moose would take his call at being real with those kinds
>of limits. You're up there, go ask one!

If you want your audio to attract moose, please get a bullhorn
and head for the woods. But stay off the ham bands with it.

While you are at it... Learn not to top post and learn to trim
unnecessary quoted text. Bandwidth is important in places other
than a ham rig too.

You don't have a clue about Usenet either, do you. Take a look
at *any* of the thousands of Usenet guides on formatting articles.
Take a look at RFC-1855. Do a google search on "netiquette".

Nobody made me god, and that has nothing to do with your arrogant
ignorance of what works and what doesn't, on Usenet or on ham radio.

Service manual wont help.
First thing is to check you voltage regulator board. It must be exactly 5
volts or what you see will continue.

After making sure the voltage is 5v you the need to play 'golden
screwdriver'.

Look at the front panel. You will see a RIT (Clarifier in Yaesu speak). Go
to the bottom panel and remove it.

Look around that control and you will see a very small PC Board type of a
pot. This is the adjustment that will align the rx with the tx.

Now here is the fun part. And if you have another rig handy it is a whole
lot easier. If not get on a dead band with a local buddy.

Have him call you and you tune him in to sound right. But he will tell you you are off frequency. Have him tune to YOU. Then when he comes back YOU ADJUST YOUR CLARIFIER.

From now on dont touch the main VFO.

Not on panel where he is off on your clarifier and adjust the control under the panel. You will have to play back and forth a lot. But the idea is to match up with the clarifier set to OFF.

Its a pain. But it works.

Brian:

How much output you get out of the amp does depend on the condition of the tubes, but you didn't say whether the tubes were grid driven or cathode driven (grounded grid).

If they are run grounded grid, 4 watts in to get 43 watts out is very reasonable for a pair of healthy tubes. Depending on plate voltage and the bias setup, you could very well drive it to higher output. But keep in mind that in AM operation the peak output can be up to 4 times the unmodulated carrier power, so with 43 watts of carrier output you can be running over 170 watts peak output at 100 percent modulation.

You may be able to drive it with 25 watts of SSB and get close to 250 watts out. Be sure to get some stations to tune around your signal and let you know if they hear anything bad.

I have a Hallicrafters BC-610I that looks like it has not many hours usage. It has been stored for about 15 years until discovered by me a few days ago. The cabinet is in excellent shape for a 60 year old rig. Three tubes are missing, the 250TH and two 100TH, but the others are there. There are three TU-52 Tuning units, the 6.35 to 8.0 MC, 12.0 to 18.0 MC and the 3.2 to 4.0 MC. There is one JK 14204 KC Type H 43 Crystal. Also included is the 51C709 Coil Unit C-390-C 5.7-8.0 MC Coil in pretty good shape. All the knobs are there as well as all toggle switches and gages. The glass on the gages is intact. This unit is mounted on a heavy duty cart that has metal ball bearing wheels. I hope some one will come to Abilene Texas and pick it up before I have to part it out or try eBay. The wiring looks very good as well as all the relays. Price is 750 and you pick up in Abilene, Texas. Thanks

Brian,

Not enough info: please post these measurements.

1. Plate voltage
2. Plate current, both resting and peak. If possible, measure it with a
two-tone input at 100% modulation.
3. Screen voltage and current (Is the 6LQ6 a tetrode? Sorry if it's not).
4. Grid voltage and current.

Also, provide any other information about the amp that you can: type of
input circuit, output circuit, etc.

HTH.

73, Bill

Well, using it as an AM linear isn't too good in the first place, as
the overall efficiency is less than 30%.

AS in the other posts, check plate input power (plate voltage x plate
current). I'm sure it is running grounded cathode, and you should be
at about 200 mils plate current or better if the tubes are good.
Plate voltage should be anywhere from 600 to 800 volts.

Use the CW mode and tickle it with a watt or two of drive and figure
out the power gain (Power out divided by power in). Advance the drive
until the amp saturates i.e. no further output for increasing input.
If the plate current is less than 200 mils then you've got flat tubes
and they'll set you back almost a C note for a pair. That's probably
why you got the amp cheap.

Also beware that these amplifiers weren't built to exacting
specifications for linearity, or spurious products. I'd always use a
LP filter on the output, and an antenna tuner to provide another tuned
circuit to clean things up a bit.

What you might do, is find a 'higher' voltage 6LQ6, one with a
different first digit (filament voltage). These quite often go very
cheap. Then provide a filament transformer to light them. For
example, 25LQ6 ----> 25.2vac transformer. If it is a mobile (12vDC
input) amp, use a pair of 12LQ6's and tie the filaments in parallel.

If you can't find tubes, I'd gut things out and put in a pair of
6146's. They're readily availabe, rugged, and can quite often be had
for $5-10 a pair. You'll have to change the tube sockets of course to

octal, but the operating voltages and the Pi network should be close to the same. And you won't detract from the value of the amp -- you'll gain.

Thanks to all for the info; it looks if I will have to do some circuit tracing before I go any further. It looks like about an even chance it will be used as an amp or cannabilized for parts.

As to SSB AM, (called "AM Equivalent" by the military) some radios will do this, but others won't.

The military surplus GRC-106 for instance does this, and the final is a linear amplifier with associated efficiency issues. To the listener, it sounds like AM, but they can tell that a sideband is missing if they tune around.

The Johnson Viking for instance does not do it, and the final is a class-C stage modulated by a class AB2 push-pull stage.

So some gear just can't do it. I don't prefer linear amplifiers as final stages for AM, but it's an opinion.

There is nothing wrong with either mode. SSB AM can be used in the AM nets along with DSB AM.

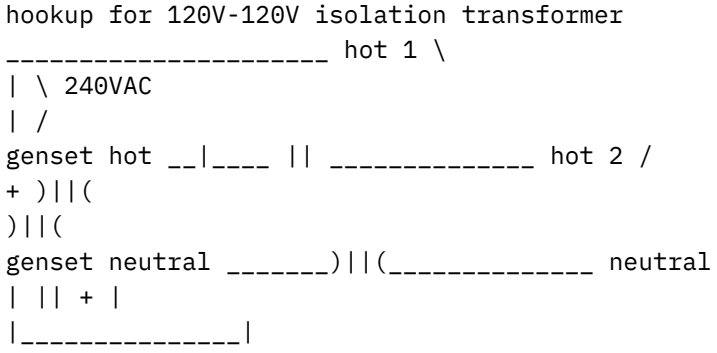
I am looking for a 120V to 120V isolation transformer, or a dual voltage unit, does not matter as long as it will handle at least 2KVA and as much as 3.5KVA and do 120 in 120 out, 60 Hz.

Proposed use is to connect to a 120VAC gasoline driven generator set, and thereby obtain 240VAC by 'stacking' the isolated 120VAC under the generator's 120VAC.

I have also been told that a 120 to 240 VAC center tapped transformer would do the job.

If you think you have something suitable to sell reasonably, and are within perhaps 100 miles of Dallas Texas, please let me know. hi-resolution images are welcome.

"best viewed with 'courier new' font"



I have posted to several groups, and can't always check all of them, so please reply to me.

I have for sale a most rare RME DB-23 preselector. This is a low-noise r.f. amp. used to substantially improve performance of the older boat-anchor receivers. Covers ham bands 80/75, 40, 20, 15 and 10 meters, but not the WARC bands. Compace size, 7 1/2 w, 5 h, 6 d.

Unit in super nice cond. All original with orig. knobs. Lettering is nice and bright. With instx. sheet and orig. box. Very little apparent use.

$50.00 money order, plus shipping ups in USA. Shipping wt. approx 7 1/2 #

Please reply by private e-mail, if interested.

Greetings Friends of the Filament,
I have a problem on my SX110 that I have been trying to trace down for a while. When the BFO is turned on, the set goes quiet unless I turn off the AVC. I know the directions say to do this, but...in the 60's when I had a new SX110, it didn't behave this way. Also since it is the same basic circuit as the S 40, etc. and they don't behave this way, I am trying to trace out the problem. Pin 2 (plate) to the 6SC7BFO tube reads 217v instead of 235v. R28 that feeds it is about 10% too high. But my problem is too much injection overwhelming the AVC circuit. Changing R28 would increase the injection...wouldn't it? When I touch Pin 3 (grid) with a digital meter, the signals return as if it is bleeding off some of the injection.
Is my problem with the BFO circuit or the AVC? Could someone else who has a SX110 let me know if theirs behaves this way? All help is appreciated. 73 Mike KF6KXG

I recently was given a heathkit SB101 by a friend who has
gotten out of ham radio. Radio is in very good condition. The only
thing he seems to have lost is the manual (of course) ! Does any one
have a manual scanned in they could send by email? I have only found
partail manuals online so far.

You can email me at oasisin@_SPAM_FILTER_nbnet.nb.ca

Just remove the _SPAM_FILTER_ first

---
I don't have an SX110, but I did peruse the schematic for one. The problem is in how the receiver is designed and used. The BFO signal is injected to the control grid of the last IF amp. The amplified BFO signal voltage from this stage drives the diode detector, which provides the AGC voltage back to the earlier stages.

When you turn on the BFO, which is a fairly high-level signal, it causes the AGC to greatly reduce the gain of the RF amp and the two IF amps. This will cause the receiver to go quiet. It is normal, given the design.

If it is, you have a heck of a nice classic linear-tuning sorry-state radio,
using the Wadley loop that made Racal famous. Nice to use, and sounds great,
but the front-end FET may be fried (aren't they all?). 73, Mike K.

Very Rare. Got my ticket in 1957 and as all young hams tried to
memorize all the spechs on ALL the radio's and I have never seen
this model before. It looks to be commercial with the rack mount.
the add says the SX-88 is a 20 tube radio. Looking in my WRL
catalog for 1956 the SX-100 was a 15 tube radio. They have a
SX-62A with slide rule dial, the most expensive hallicrafters receiver
in the book at $349.00. It may be a re-engineered SX-100 but I
suspect it was a special model considered too expensive for Hams.

Can you read the writeing under the left frequency display?

The two frequency tuneing knobs, or a close simalarity were used
on the SX-101 about 1958 to 1961.

It is Rare, But not that rare for my money.. <G>

Rare but also the top Hallicrafter's receiver from the era. It
was priced way up there when new, I'm guessing over $500 and that's
when a new car was about $1500 and a coke was a nickel. Figure you
pay over $15,000 for car and 50¢ for that coke, that radio should be
$5,000.

I've never used one or seen one even. But then I've never used an
R390, 51S1, SX-115, NC-303 either.

Very rare indeed.

The page at http://antiqueradio.org/halli09.htm says only about sixty
are known to exist. It was produced for only two years, 1954 and
1955, priced at $595!!!

Hi to all,

I have finished up with a nice old NCX-3, but it needs an S meter to make it complete! Anyone out here got one laying around and willing to part with?

Thanks for any responses

re: << It may be a re-engineered SX-100 ....>>

No similarity of design at all. I owned a SX-100 new.

The SX-88 appearance and some of the design ideas put it close to the HT-32B transmitter in date and quality.

Don

The SX-88 is the holy grail of Hallicrafters communications receivers. It is the rarest, and most desirable to collectors, and there are a great many enthusiastic collectors of Hallicrafters radios. While it is absolutely not in the same class, performance-wise, as an R-390a, it is a very fine 20 tube double conversion receiver. And, there were what...30,000+ R-390a's made? As was mentioned in a previous reply, it is extremely scarce. I have read that only 60 were (if memory serves) sold. $595 was a boatload of money in 1954, and this radio was only available for two years. There were approximately 1,000 Hammarlund Pro-310's sold, and one of those in good condition will fetch near $2,000. I have seen a junk 88 parts radio bring over $1,000. I will be very, very surprised indeed if this one doesn't go well north of $5,000.

Clay

I don't think anybody has been butchering pristine boatanchors since the days when they were being sold surplus for little more than pocket change. There must be 10 cheap beat up ones suitable for modification for every nice one out there. However, I just put a RCA connector for a Q-Multiplier on the chassis of my Drake SW-4A. The SW-4A was "imperfect", however.

Sure. Considering the ham and SWL communities, I'm convinced the shortwave radio gene is right next to the grouchiness gene.

I suppose advertising has much to do with the fascination. The SX 88 was featured prominently in most of the Hallicrafters advertising at the time, back when thousands of kids couldn't even afford the S-38. I think the 88 was the Allied cover radio and probably other catalogs. Now, I suppose a few dozen of those kids can now afford not only several S-38s, but the dream radio, too.

I see it still appears that no one bothered to plug "MC145145P" into
Google.

Well folks if you invested $595 back in the 50's at 8% interest compounded annualy it would now be about -- yep you guessed it $10,000.

Or you could have bought an SX-88 and enjoyed the radio for 30+ years.

Tongue in cheek of course

Don,
Thank you for the reply. That is what I have heard from others too. But how come my new SX110 (in 1961) and my current SX99 (same circuit) doesn't "block out"? Mike KF6KXG

Yes I did Clinton. That is where the comtrade reference came from in my earlier email. Copy of relevant section from 31/7/03 follows:-

Thanks for your e-mail dated 31//7/03. Unfortunately the
G 1090550 MC145145P was discontinued by Yaesu back
On the 1/06/02 and therefore is no-longer available.

Another company worth trying is lowe Electronics @

http://www.lowe-electronics.com

Or Comptrade @

http://www.comptrade.com/
